

SPIIRAS Team in RE-TRUST: team background and preliminary analysis of tasks to be solved

Igor Kotenko

**Computer Security Research Group,
St. Petersburg Institute for Informatics and
Automation of Russian Academy of Sciences**

Contents

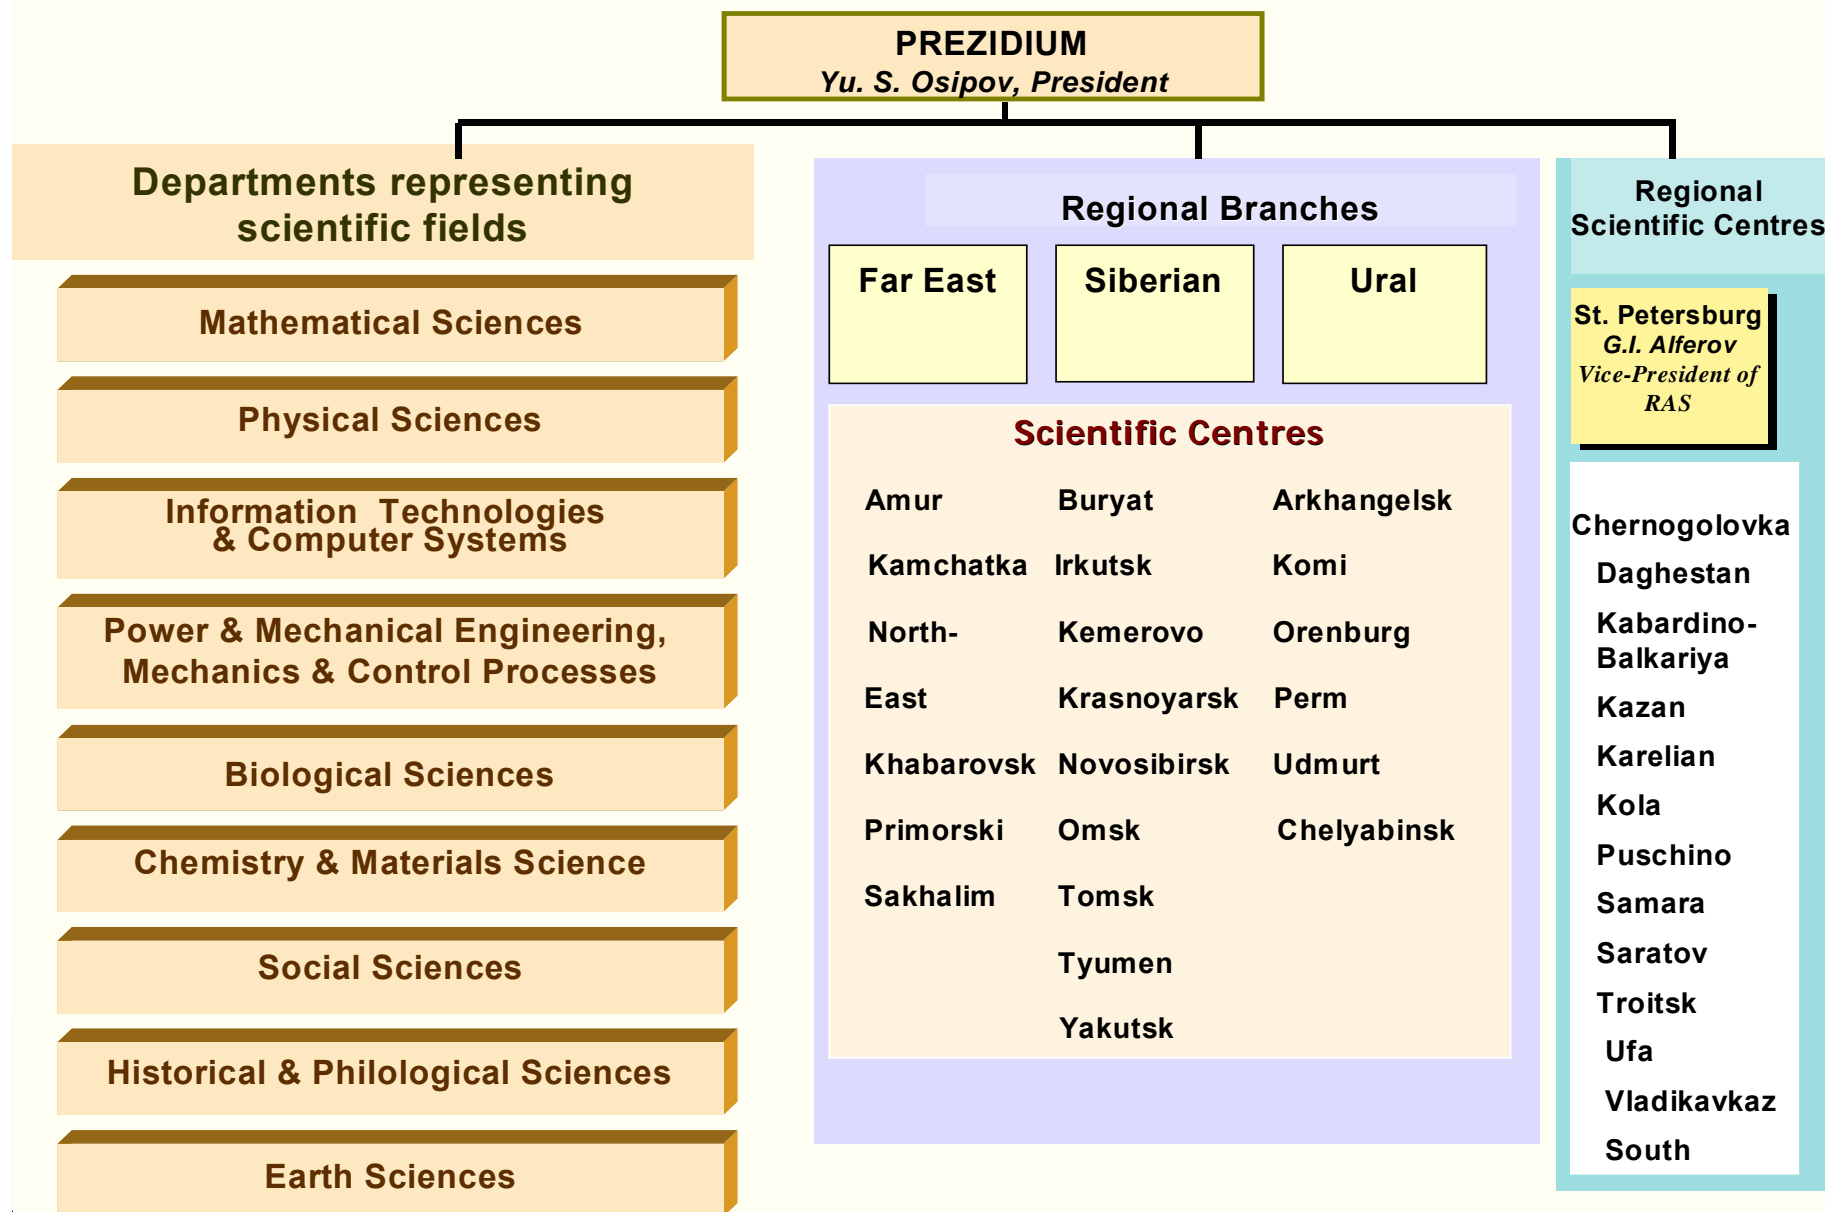

1. **St. Petersburg Institute for Informatics and Automation of the Russian Academy of Sciences (SPIIRAS)**
2. **International collaboration, projects and accomplishments of Computer Security Research Group**
3. **Tasks in RE-TRUST**
4. **Computer Security Research Group research - General view**
 - Modeling and simulation of computer attacks
 - Security analysis of computer networks
 - Intrusion detection
 - Deception systems, honeynets
 - Modeling and simulation of cyberwarfare
 - Security policy specification and checking
 - Security protocols analysis

1. St. Petersburg Institute for Informatics and Automation of the Russian Academy of Sciences (SPIIRAS)

SPIIRAS

STRUCTURE OF THE RUSSIAN ACADEMY OF SCIENCES

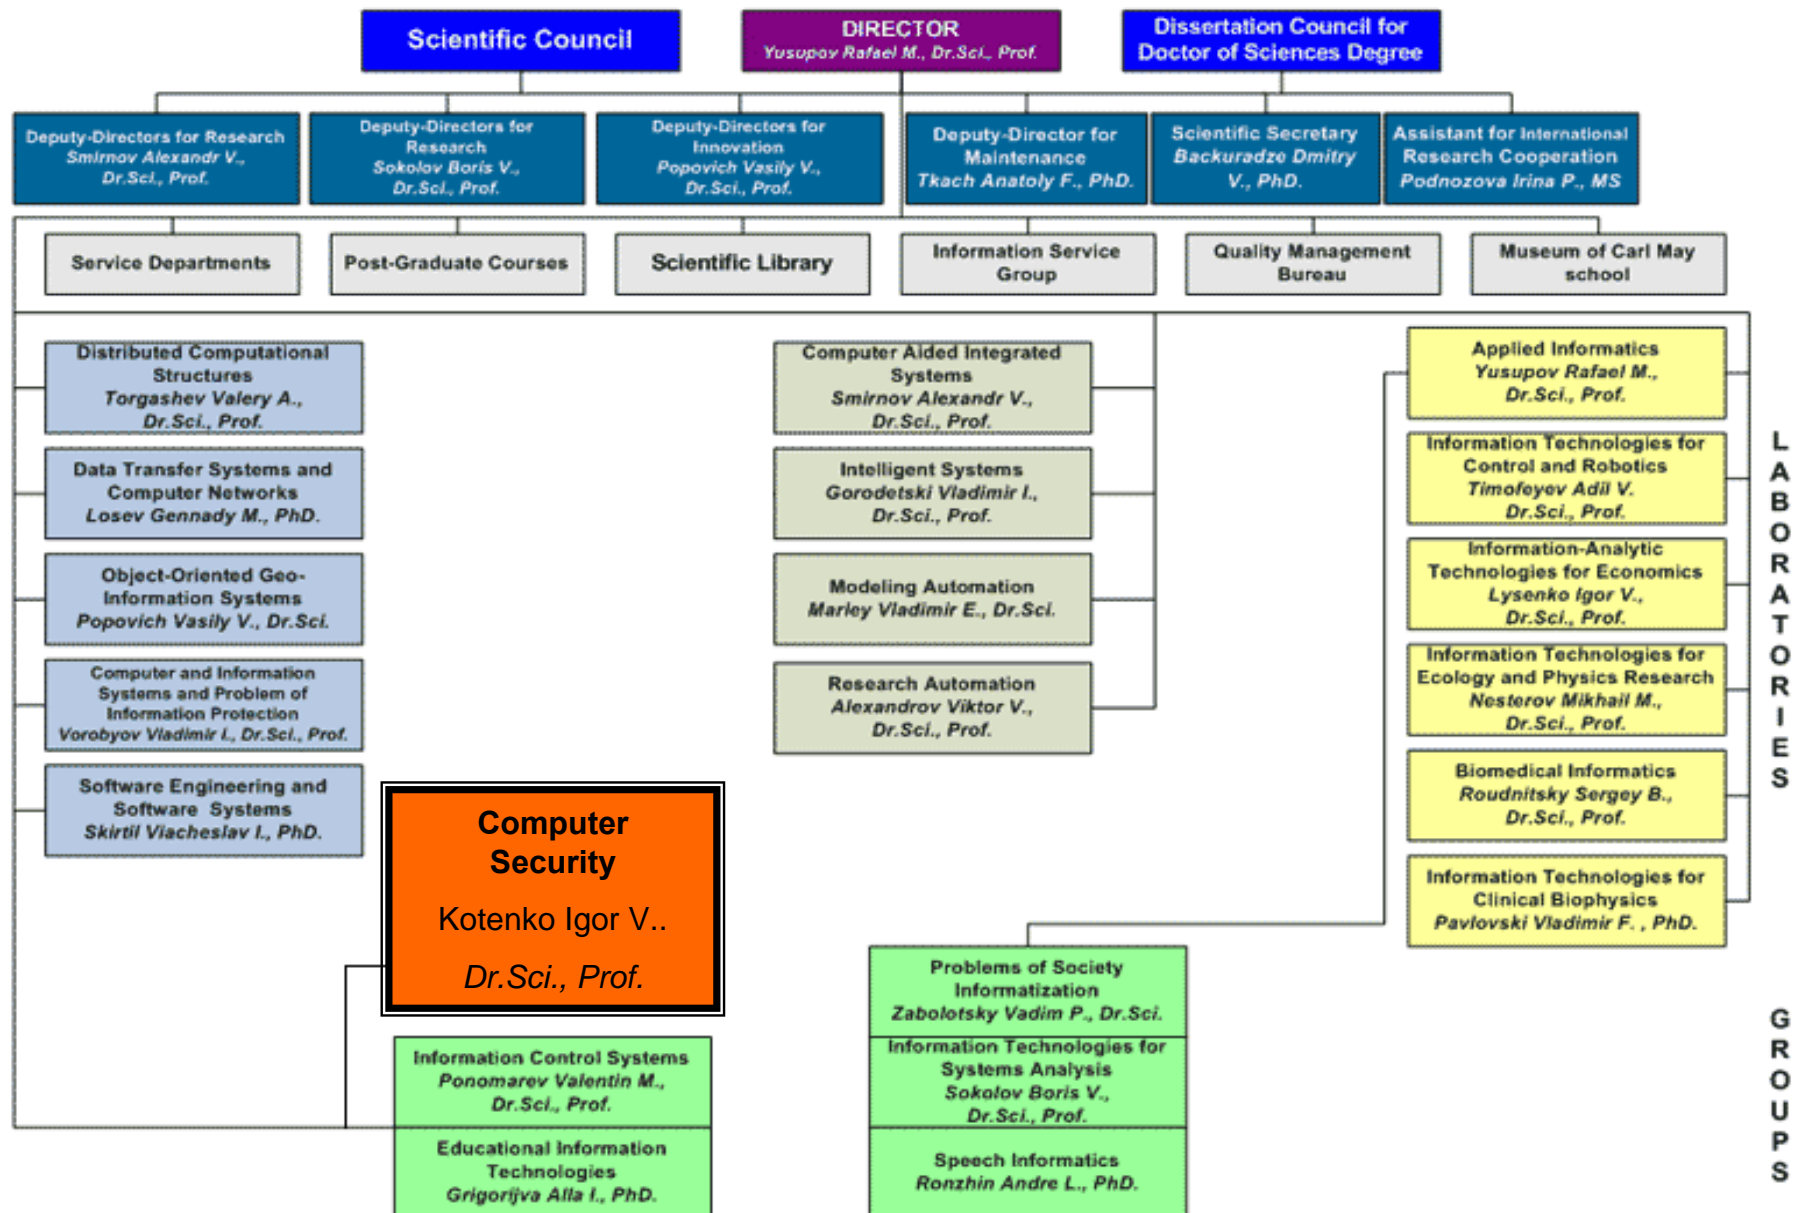

Short Profile of St. Petersburg Institute for Informatics and Automation (SPIIRAS)

- Founded in 1978
- The Russian Academy of Sciences Institute operating in the North-West of Russia in Information Technologies
- Personnel – 203
- SPIIRAS is a competence center in the area of advanced information technologies
- Experienced in collaboration with EC Countries

SPIIRAS Structure

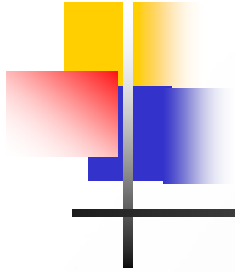

SPIIRAS General Research Directions

- Development of Information and Control Systems for Real Time Signal Processing
- Fundamentals of Information Processes in Complex (Socio-, Eco-, Bio-, Geo-, etc) Systems
- Theoretic Basics in Developing Information Technologies for Research Automation, Control, Manufacturing, and Intelligent Systems

Research Directions of Computer Security Research Group

- **Computer security**, including security policy management, access control, **authentication**, **network security analysis**, intrusion detection, firewalls, deception systems, virus protection, **verification of security systems**, modeling, simulation and visualization technologies for counteraction to cyber terrorism;
- **Artificial intelligence**, including multi-agent frameworks and systems, soft and evolutionary computing, machine learning, data mining, data and information fusion;
- **Telecommunication**, including decision making and planning for telecommunication systems.

2. International collaboration, projects and accomplishments of Computer Security Research Group

SPIIRAS

International Projects

- Air Force Research Laboratory/ Information Directorate (European Office of Aerospace Research and Development) (1999-2003 - 3 computer security projects)
 - “Agent-Based Model of Information Security System: Architecture and Formal Framework for Coordinated Intelligent Agents Behavior Specification” (1999-2001)
 - “Formal Grammar-Based Approach and Tool for Simulation Attacks against Computer Network” (2001-2003)
 - “Mathematical Foundations, Architecture and Principles of Implementation of Multi-Agent Learning Components for Attack Detection Computer Networks” (2001-2003)
- INTEL – “Network traffic preprocessing algorithms” (2004-2005)
- Fraunhofer First (Germany) – “Intrusion detection learning systems” (MIND) (2004-2006)
- FP6 (EU Project) – “Security policy specification, checking and deployment” (POSITIF) (2004-2007)
- ...
- FP6 (EU Project) – “Remote EnTrusting by RUn-time Software auThentication” (RE-TRUST) (2006-2009)

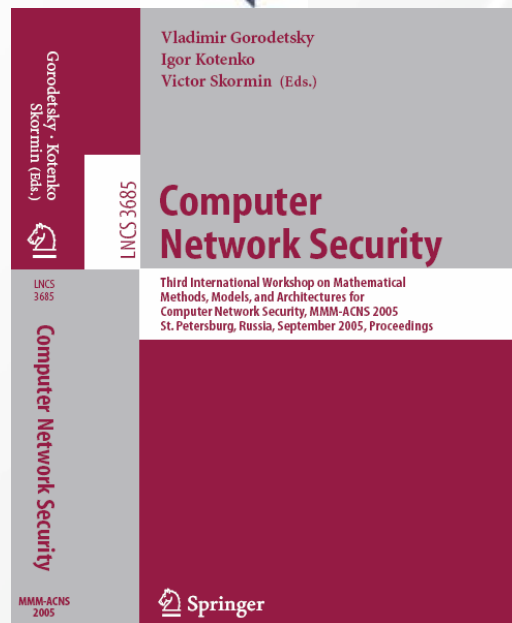

Russian Grants and Projects

- Government Budget Projects:
 - Models and methods of developing secure computer systems (2006-2008)
- Grants of Russian Foundation for Basic Research:
 - Mathematical models of information security assurance in computer networks based on MAS technology and its experimental evaluation (2001-2003)
 - Modeling and simulation of cyber warfare (2004-2006)
- Projects from Department of Information Technology and Computer Systems of the Russian Academy of Sciences:
 - Agent-based stochastic modeling and simulation of adversarial competition of teams in the Internet environment (2003-2004)
 - Mathematical models of active audit of computer network vulnerabilities, intrusion detection and response: Multi-agent approach (2003-2006)
- Projects from Government Institutions:
 - Models and prototypes of honeynets (2003-2004)
 - Monitoring of user activity in computer networks (2004)
 - ...

International Computer Security Conferences Organized

- **Mathematical methods, models and architectures for computer network security (MMM-ACNS):**
2001, 2003, 2005, **2007**

The objectives of MMM-ACNS Workshops are to bring together leading researchers from academia and governmental organizations as well as practitioners in the area of computer networks and information security, facilitating personal interactions and discussions on various aspects of information technologies in conjunction with computer network and information security problems arising in large-scale computer networks engaged in information storing, transmitting, and processing.

RE-TRUST Kick-off Workshop, September 18-19, 2006

Recent accomplishments (results) in 2005-2006 (1)

- The theoretical basis, algorithms and software implementation of agent-oriented modeling and simulation of antagonistic counteraction of malefactors and computer network security components.
 - The **principles of construction, the structure and a fragment of distributed ontology-based knowledge base** for modeling and simulation of protection mechanisms in an antagonistic environment.
 - The **formal models** of agents–malefactors, security agents and computer network under defense.
 - The **software environment** based on imitation of computer attacks and protection mechanisms at a network packets level using OMNeT ++ INET Framework.
 - The **attack and security agents** as compound modules containing simple modules, responsible for functioning of various network protocols, and agent kernel that controls these modules.
 - Different **experiments** with this environment were fulfilled on an example of simulation of DDoS attacks and particular defense mechanisms. These experiments included the investigation of attack scenarios and protection mechanisms for the networks with different structures and security policies.
 - The **received results are directed** on investigation of various aspects of antagonistic interactions of agent teams in the Internet and development of recommendations on design and implementation of advanced security systems.

Recent accomplishments (results) in 2005-2006 (2)

- **The theoretical basis and operation algorithms of deception systems (DS).**
 - These systems represent hardware-software tools for information protection that are based on the technology of “traps” and false targets. In particular, we developed **the requirements to DS, the generalized architecture of multi-agent DS, the generalized models and algorithms** of disguised counteraction to remote non-authorized access to information resources, including the models of malefactor detection and readdressing of non-authorized request to false components, determining the malefactor plan (strategy), generating a plan of false components operation, etc.
 - The offered approach is based on simulation of information systems components and on using **three levels of malefactor deception**: (1) a network segment level – the whole network segment is emulated; (2) a host level – among working servers the bait-host is used; (3) a services and applications level –the programs emulating services and applications are applied on servers.
 - The **deception software system** was implemented.
 - We fulfilled a set of **experiments** on investigating basic deception functions at realization of different attacks. These experiments are executed on several different scenarios determined according to various attack types.

Recent accomplishments (results) in 2005-2006 (3)

- **Models, techniques and prototypes for active security analysis of computer networks.**
 - The approach is based on **automatic generation and fulfillment of distributed attack** scripts taking into account a variety of goals and knowledge levels of malefactors, and intended for implementation at various stages of computer network life cycle including design and exploitation stages.
 - The offered approach is based on **application of a set of models** (including models of malefactor, attack scripts generation, security level evaluation, computer network, etc.) using expert knowledge.
 - Functioning of security analysis system based on the approach suggested is resulted in **determined vulnerabilities, the traces (graphs) of possible multistage attacks, “bottlenecks” (main “holes”)** in a computer network on which these attacks are based, and also **various security metrics** which can be used for evaluating a security level of a computer network and its components, and also for comparisons of various network configurations and security policies.
 - These results provide the **development of justified recommendations** on elimination of revealed “bottlenecks” and on amplification of system security.

Recent accomplishments (results) in 2005-2006 (4)

- The **generalized architecture, particular models and prototypes of components for verifying security policies** of computer networks were analyzed and developed.
 - The **mechanisms for operation with policies** of three levels were offered:
 - (1) the top level, approximated to the user requirement language,
 - (2) the intermediate level, classifying rules according to several policy categories, and
 - (3) the bottom level, describing policies in the format of Common Information Model (CIM).
 - We developed and implemented the **research prototypes of the verification manager that handles the process of verification, and different verification modules**:
 - (1) based on Event Calculus,
 - (2) based on Model Checking,
 - (3) Specialized modules.

3. Tasks in RE-TRUST

SPIIRAS

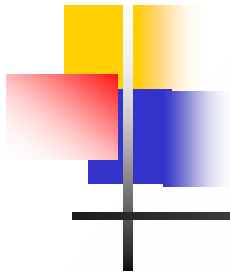

Main Tasks in RE-TRUST

Task T4.1 – Trust analysis of SW-based method

Task T4.5 – Remote entrusting and Internet secure protocols

- **T4.5.1 – Analysis of integration of remote entrusting with existing Internet security protocols**
- **T4.5.2 – Integration and analysis of secure protocols to support remote entrusting methods.**

4. Computer Security Research Group Research: General view

Examples of related developed solutions (mainly in network security analysis):

- **Modeling and simulation of computer attacks**
- **Modeling and simulation of cyberwarfare**
- **Security analysis of computer networks**
- **Intrusion detection**
- **Deception systems, honeynets**
- **Security policy specification and checking**
- **Security protocols analysis**

Security Evaluation Areas

- **Impact assessment** for determining how security measures affect system and application properties (performance, reliability, etc.)
[D.Nicol, S.Smith, M.Zhao-04 ; S.Kent, C.Lynn, K.Seo-00 (Secure BGP); M.Zhao, S.Smith, D.Nicol-05; etc.]
- **Emulation**, in which real and virtual worlds are combined to study the interaction between malware and systems, and probe for new system weaknesses [G.Bakos, V.Berk-02 (Worm activity by metering ICMP); M. Liljenstam et al-03 (Simulating worm traffic); etc.]
- **Cyber attack exercises** and training scenarios
[M. Liljenstam et al-05 (RINSE); B. Brown et al-03; etc.]
- **Risk assessment** based on known vulnerabilities, exploits, attack capabilities, and system configuration [R. Ortalo, Y.Deswarte, M.Kaaniche-99; Sheyner et al-02; V.Gorodetski, I.Kotenko-02 (Attack Simulator); B.Madam, K.Goseva-Popstojanova-02; etc.]
- ...

Works on Security Evaluation

- Methodology and software tools for testing IDSs ([Puketza *et al*-96], [Puketza *et al*-97], [Debar *et al*-98], [Alessandri *et al*-01], [McHugh-00]);
- Evaluations of IDSs of MIT ([Lippmann *et al*-98, 00, 02]);
- Real-time test bed of AFRL [Durst *et al*-00];
- Dependability models for evaluation security [Nicol *et al*-04];
- Penetration testing of formal models of networks for estimating security metrics [Sheyner *et al*-02];
- Model checking for analysis of network vulnerabilities [Ritchey, Ammann-00];
- Global metrics for analyzing the effects of complex network faults and attacks [Hariri *et al*-03];
- Natural-deduction for automatic generation and analysis of attacks against IDS [Rubin *et al*-04];
- Knowledge-based network risk assessment [Shepard *et al*-05], etc.

Works directly coupled with Attack Modeling and Simulation

- Using Colored Petri Nets [Kumar *et al*-94];
- State transition analysis technique [Iglun *et al*-95], [Kemmerer *et al*-98];
- Conceptual models of computer penetration ([Cohen-99],[Stewart-99]);
- Descriptive models of attackers [Yuill *et al*-00];
- “Tree”-based models of attacks ([Moore *et al*-01], [Dawkins *et al*-02]);
- Modeling survivability of networked systems [Moitra *et al*-01];
- Object-oriented Discrete Event Simulation [Chi *et al*-01];
- Situation calculus and goal-directed procedure invocation [Goldman-02];
- Using and building attack graphs for vulnerability analysis ([Swiler *et al*-01], [Ortalo *et al*-01], [Sheyner *et al*-02], [Jha *et al*-02]);
- Game-theoretic models [Lye and Wing-03];
- Multi-stage attack analysis [Dawkins, Hale-04];
- Modeling and inference of attacker intent, objectives, and strategies [Liu, Zang-05]; etc.

Security Analysis

- ① Model system
 - ② Model adversary
 - ③ Identify security properties
 - ④ See if properties preserved under attack
- Result
 - Under given assumptions about system, no attack of a certain form will destroy specified properties
 - There is no “absolute” security

/Vitaly Shmatikov/

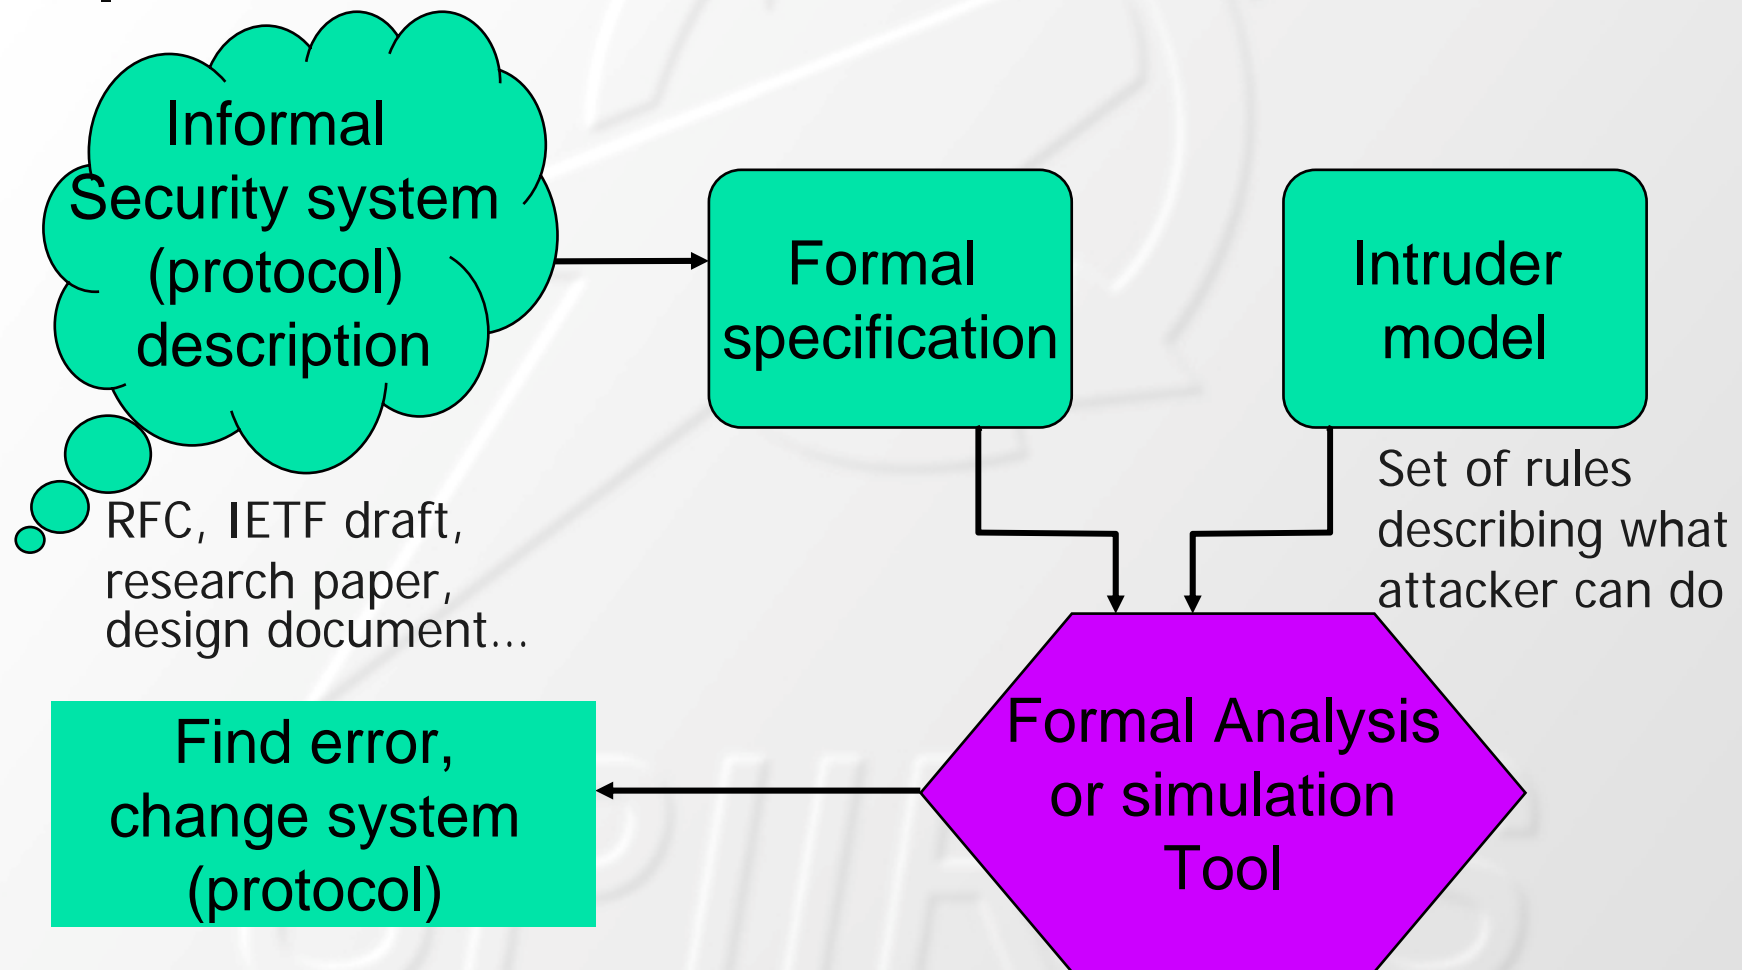

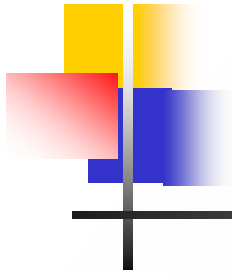

Fundamental Tradeoff

- Formal models are abstract and greatly simplified
 - Components modeled as finite-state machines
 - Security functions modeled as abstract data types
 - Security property stated as unreachability of “bad” state
- Formal models are tractable...
 - Lots of verification methods, many automated
- ...but not necessarily sound
 - Proofs in the abstract model are subject to simplifying assumptions which ignore some of attacker’s capabilities
- **Attack in the formal model implies actual attack**

/Vitaly Shmatikov/

Explicit Intruder Method

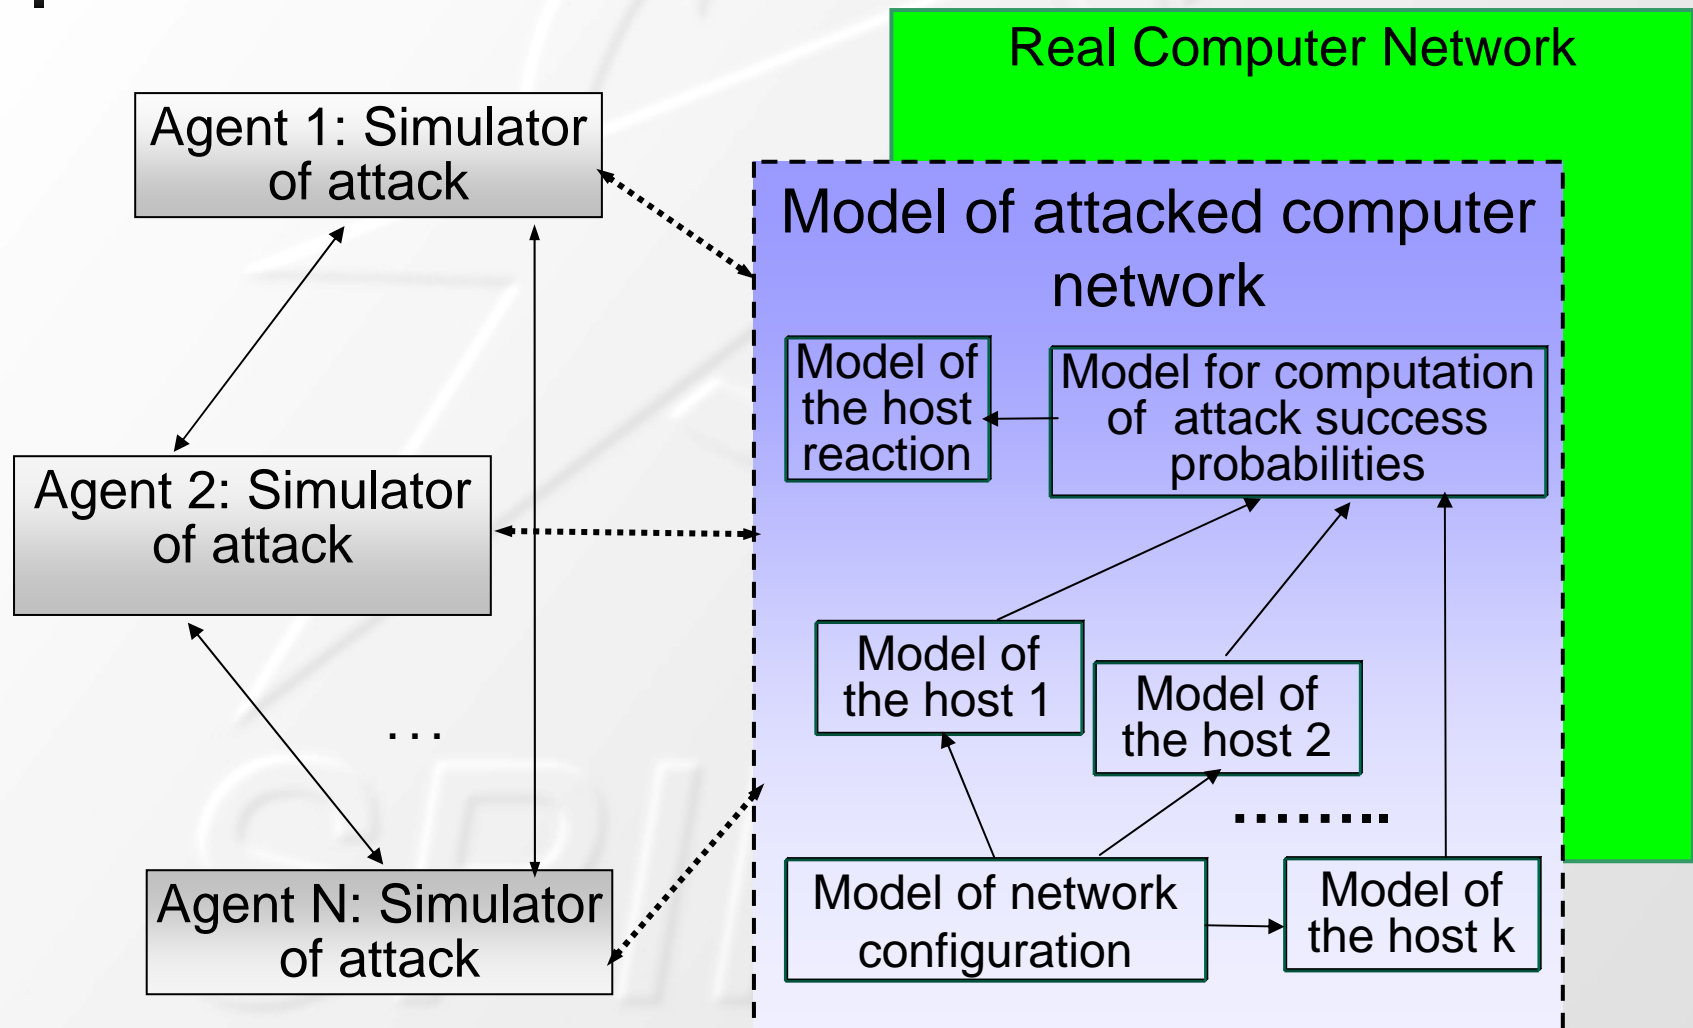

- **Modeling and simulation of computer attacks**

SPIIRAS

Conceptual simulation scheme

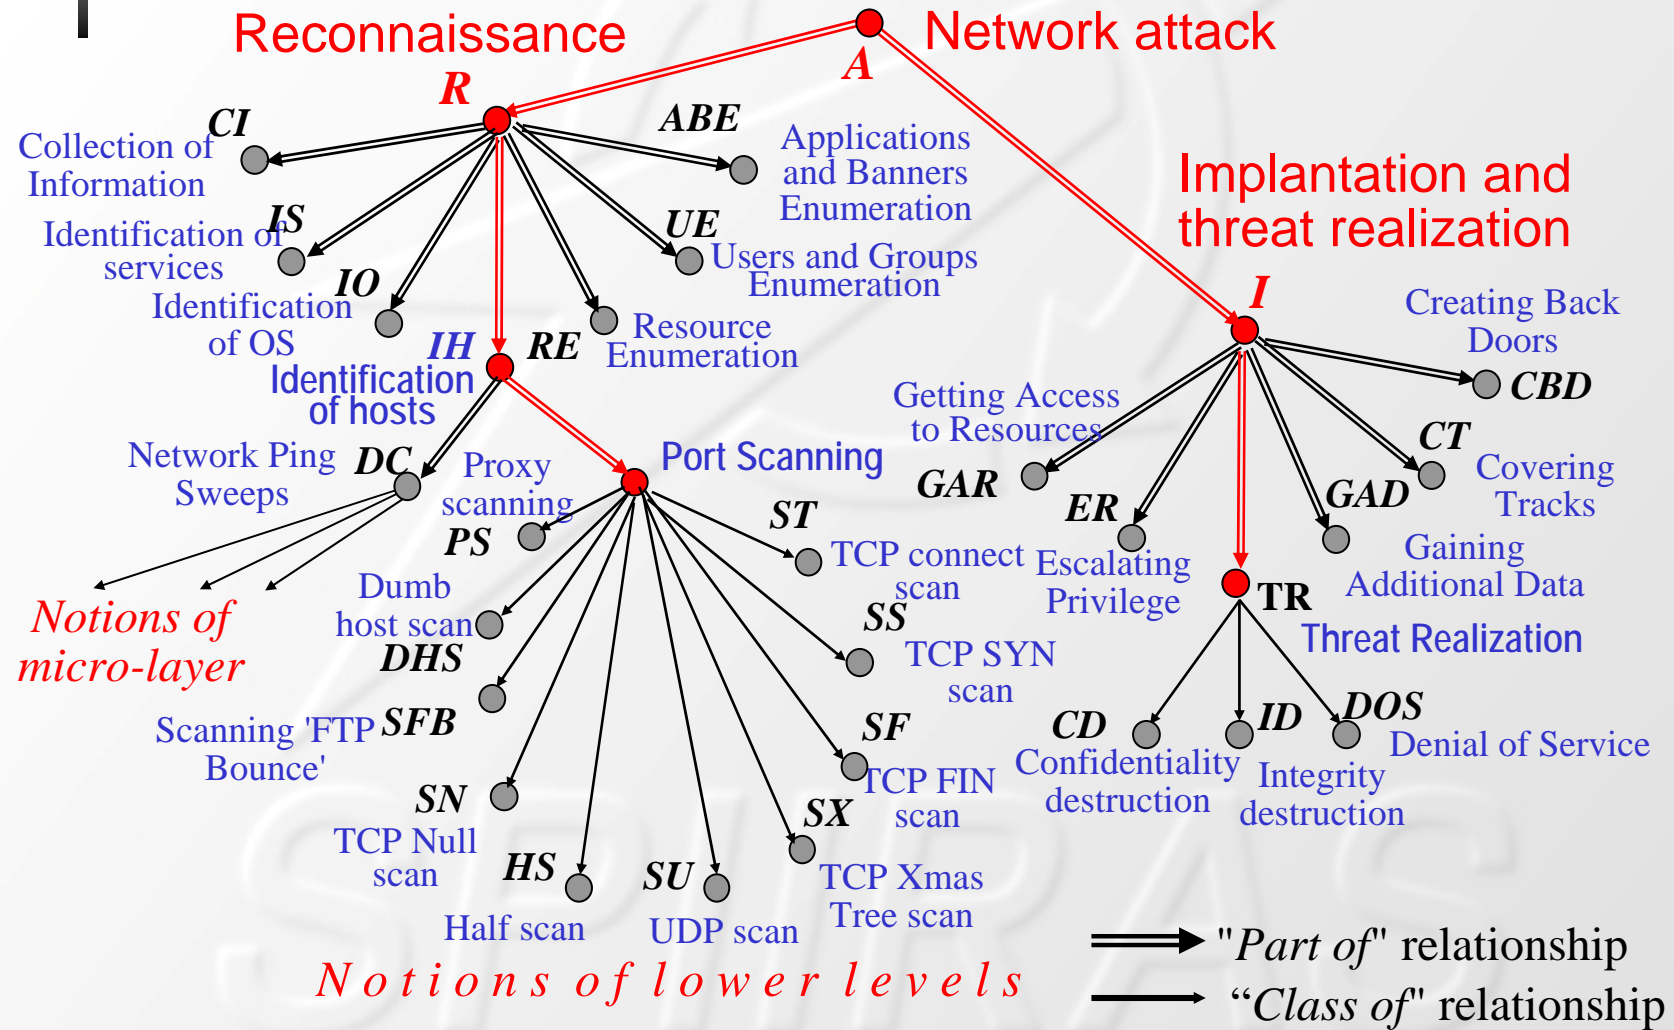

Basic Components of Attack Model

1. **Ontology of the Problem** “*Attacks against Computer Network*” : structure of the basic malefactors’ intentions and actions.
2. Basic **malefactors’ intentions** and **attack task specification**.
3. **Formal grammar-based framework** for specification of attack development.
4. Formal scenarios of a **representative multitude of attacks** and their development in time.
5. Formal model of the **attacked computer network**.
6. Model of **interaction** of malefactor’s activity and victim computer network.

Partial Ontology of the Domain “Attacks against Computer Network” (Macro-levels)

Basic malefactors' intentions

Intention-centric approach to the specification of malefactor's activity: basic notions of the domain correspond to the malefactor intentions and all other notions are structured according to the structure of intentions.

List of Basic Classes of High-level Malefactor's Intentions

R – Reconnaissance:

IH – Identification of the running Hosts

IS – Identification of the host Services

IO – Identification of the host Operating system

CI – Collection of additional Information

RE – shared Resource Enumeration

UE – Users and groups Enumeration

ABE – Applications and Banners Enumeration

I – Implantation and threat realization:

GAR – Getting Access to Resources of the host

EP – Escalating Privilege with regard to the host resources

GAD – Gaining Additional Data needed for further threat realization

TR – Threat Realization

CD – Confidentiality Destruction

ID – Integrity Destruction

DOS – Violation of resource availability (Denial of Service)

CT – Covering Tracks

CBD – Creating Back Doors

Attack task specification

The screenshot shows the 'Specify the Attack' dialog box. It has several sections: 'Intention' with a list of 12 items, 'Hacker Configuration' with fields for IP addresses and a passwords file, 'Known Information about attacked Networks' with two tables, and an 'Object of Attack' section at the bottom. Arrows point from the numbered list on the right to specific parts of the dialog: arrow 1 points to the 'Intention' list, arrow 2 points to the 'Real IP-address' field, arrow 3 points to the 'Known Information' section, and arrow 4 points to the 'Object of Attack' section.

Specify the Attack

Intention

N	Name	Description
1	IH	Identification of Hosts
2	IS	Identification of Services
3	IO	Identification of Operating system
4	RE	Shared Resource Enumeration
5	UE	Users and groups Enumeration
6	ABE	Applications and Banners Enumeration
7	GAR	Getting Access to Resources of the host
8	EP	Escalating Privilege with regard to the host resources
9	CVR	Confidentiality Violation Realization
10	IVR	Integrity Violation Realization
11	AVR	Availability Violation Realization
12	CBD	Creating Back Doors

Hacker Configuration

Real IP-address: 161 . 43 . 201 . 148 ☒ Save preceding attack realization

Spoofed IP-address: 248 . 131 . 17 . 99 ☒ Generate attacks on net protocol level

Passwords file: D:\HACKER\files\passwd.txt

Known Information about attacked Networks

Net Name	Net IP
AIL	192.168.130.0
	210.122.25.0

Host Name	Host IP
	210.122.25.4
	210.122.25.8
	210.122.25.12
	210.122.25.16
	210.122.25.22
AWE	192.168.130.137

Define Known Information

Show All Hosts

Object of Attack

Advanced

Intention: GAR IP-address: 210.122.25.16 OK Cancel

Main elements of attack specification:

- 1) Malefactor's intention (1-12);
- 2) Address of the attacked host or network;
- 3) Available information about attacked host;
- 4) Attack object (file name, user account, resource, etc.);

Formal framework for specification of attacks

Formal grammar: $G_i = \langle V_N, V_T, S, P, A \rangle$,

where G_i – formal grammar name (it coincides with the name of attack and the name of its axiom);

V_N – the set of non-terminal symbols; V_T – the set of terminal symbols; $S \in V_N$ – formal grammar axiom;

P – the set of productions which look like follows:

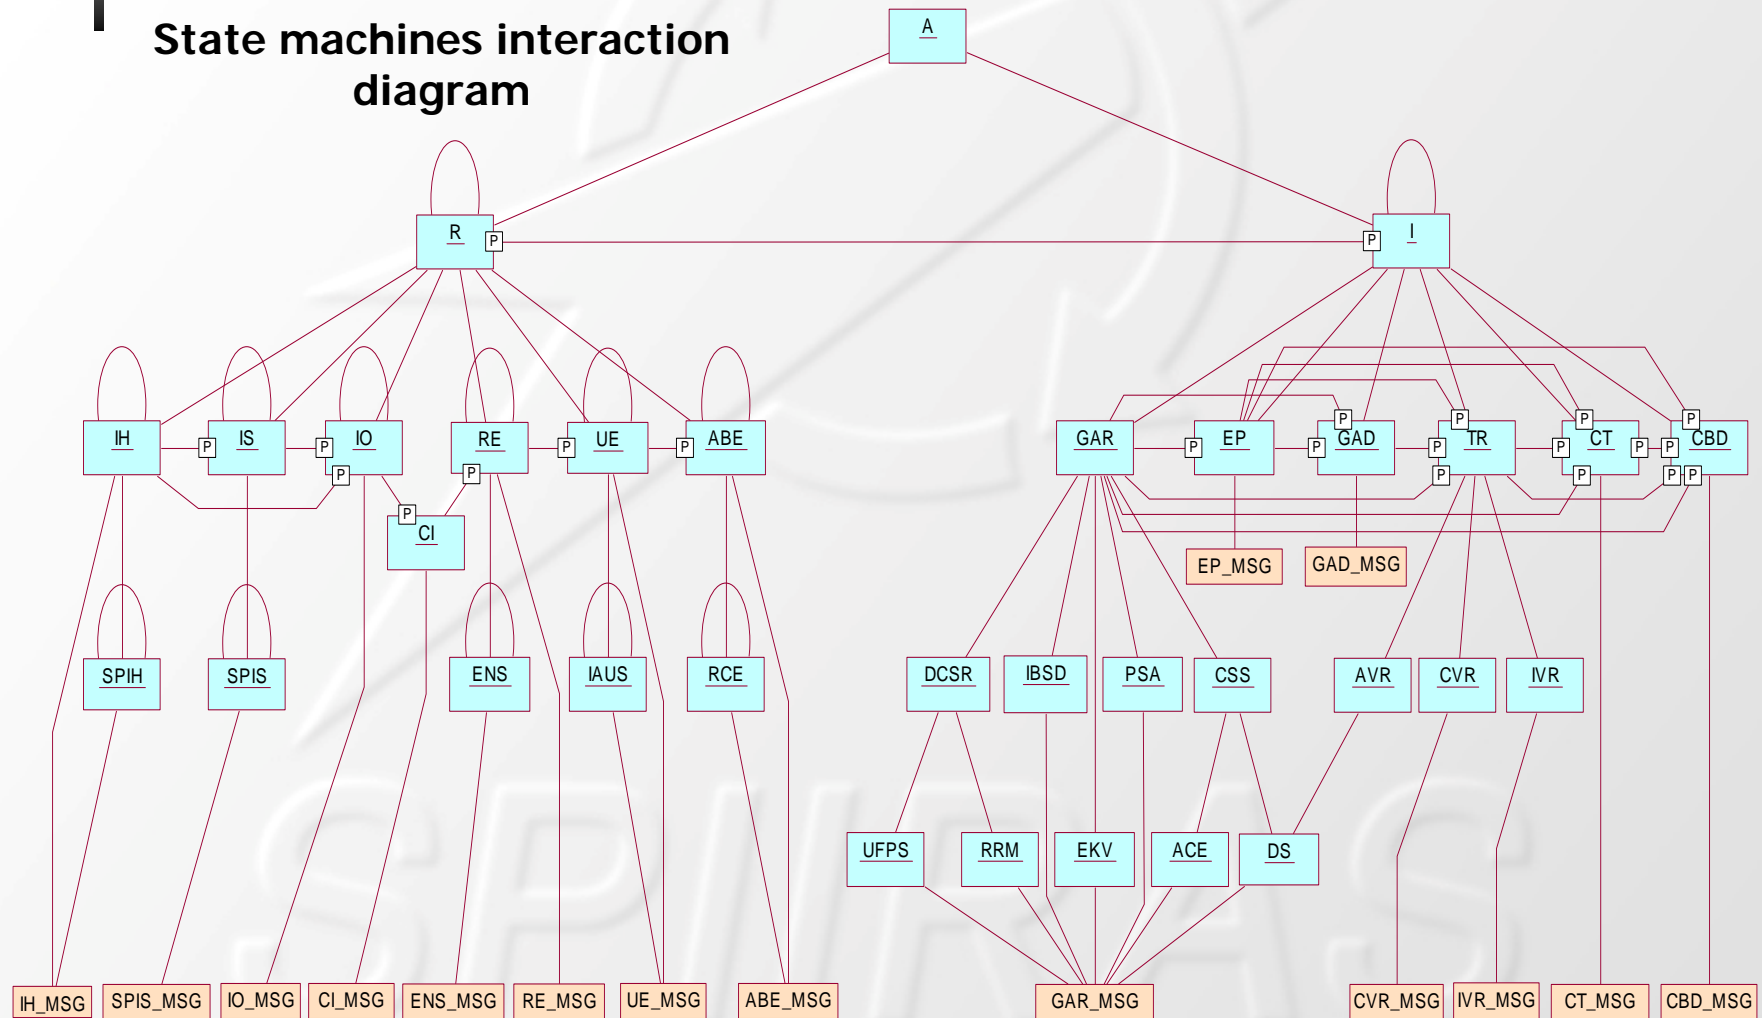

$$(U) X \rightarrow \alpha (Prob),$$

where $X \in V_N$, $\alpha \in (V_T \cup V_N)^*$, U – precondition of the production application; **Prob** – probability of the production application;

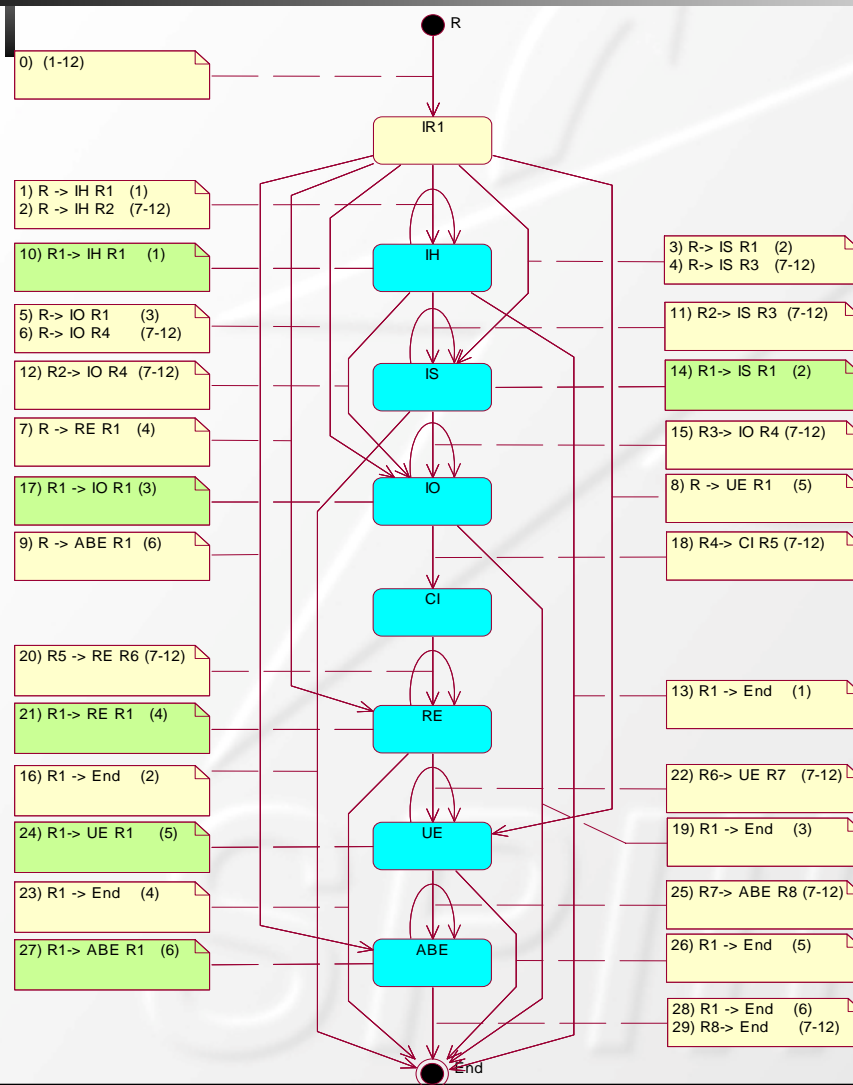

A – the set of attributes and their dependencies (functions having attributes as variables).

Implementation Issue: State Machine-based Representation of Attack Generation

State machines interaction diagram

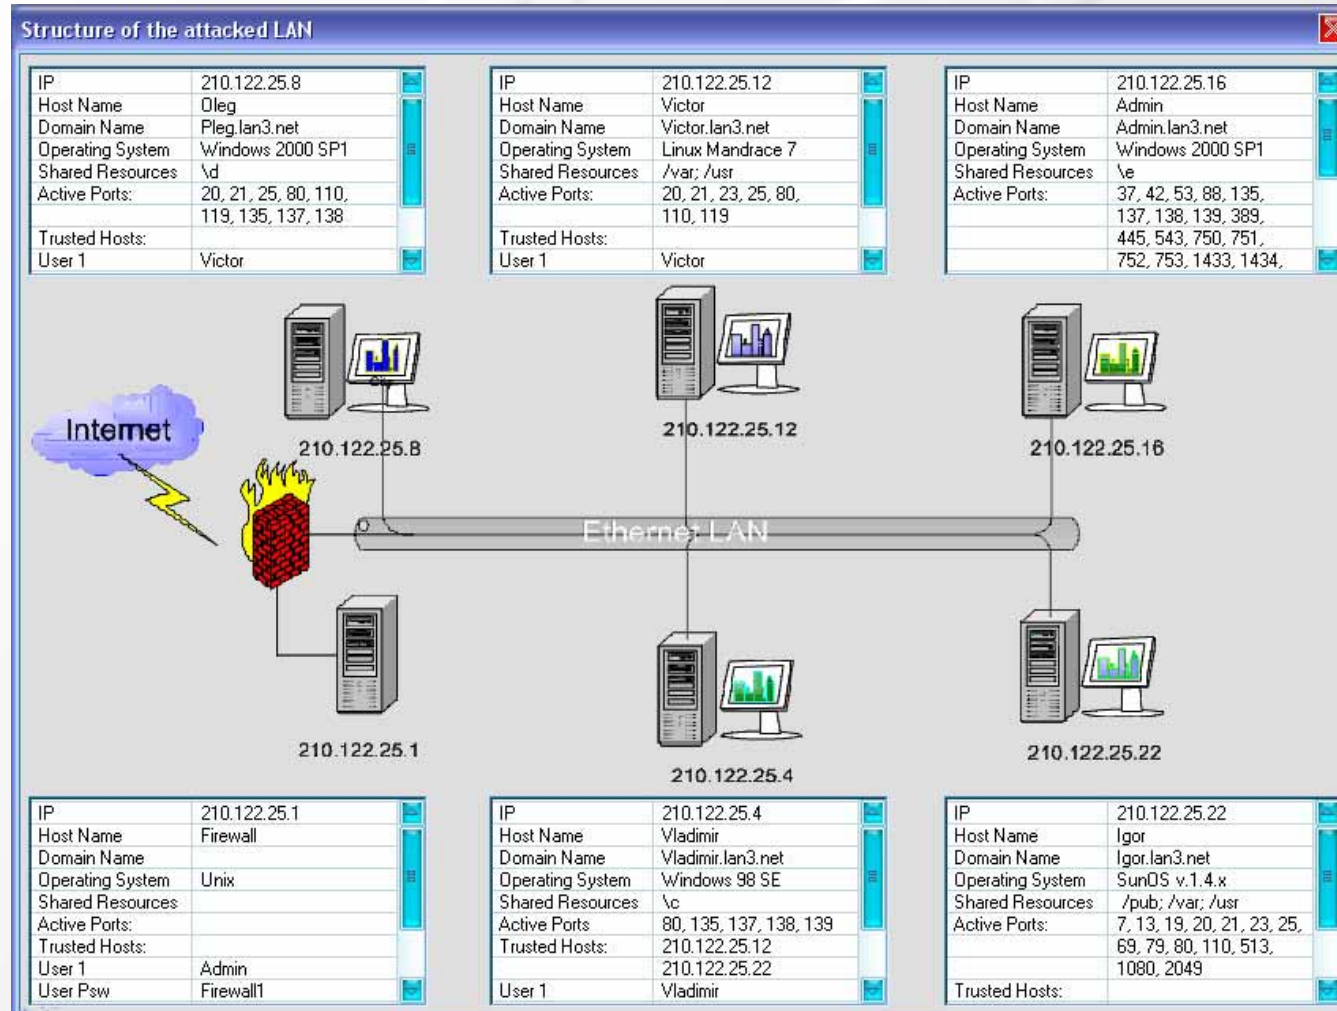

Implementation Issue: State Machine-based Representation of Attack Generation

“Reconnaissance”
Attack Generation

- IR1** – Intermediate state
- IH** – Identification of running Hosts
- IS** – Identification of Services
- IO** – Identification of OS
- CI** – Collection of Information
- RE** – Resource Enumeration
- UE** – Users and Groups Enumeration
- ABE** – Applications and Banners Enumeration

Parameters of attack realization outcome

- **NS (Number of attack Steps)** – number of terminal level attack actions;
- **PIR (Percentage of Intention Realization)** – percentage of the hacker's intentions realized successfully (for “Reconnaissance” it is a percentage of objects about which the information has been received; for “Implantation and threat realization” it is a percentage of successful realizations of the common attack goal on all runs);
- **PAR Percentage of Attack actions Realization** – percentage of “positive” messages (responses) of the Network Agent on attack actions (the “positive” messages are designated in attack visualization window by green lines);
- **PFB (Percentage of Firewall Blockage)** – percentage of attack actions blockage by firewall (red lines in attack visualization window);
- **PRA (Percentage of Reply Absence)** - percentage of “negative” messages (responses) of the Network Agent on attack actions (gray lines in attack visualization window) .

Example of experiment results for intention “Gaining Access to host Resources”

Configurations of firewalls: 1 - Both Net & Personal firewalls are active; 2 - Only Net firewall is active; 3 - Only Personal firewall is active; 4 - None of firewalls is active

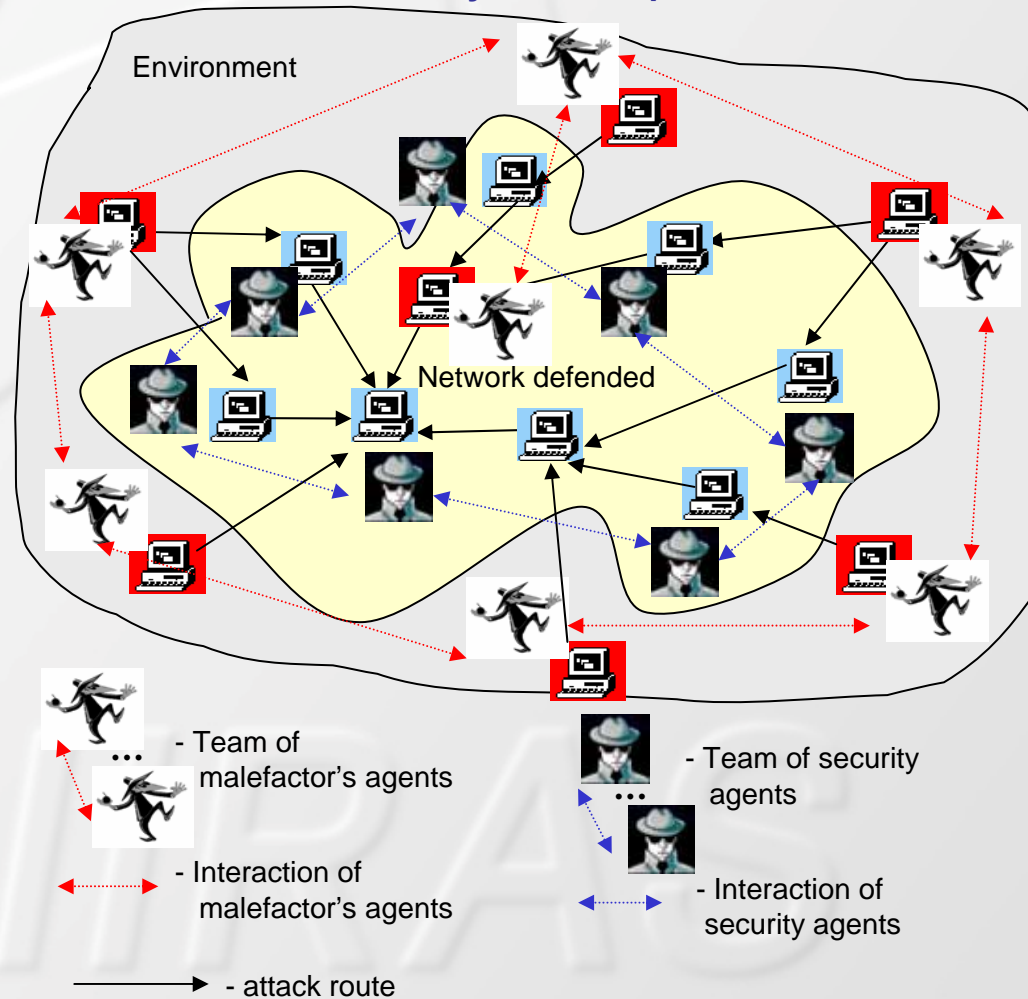

- **Modeling and simulation of cyberwarfare**
(between malefactors' teams and security teams)

SPIIRAS

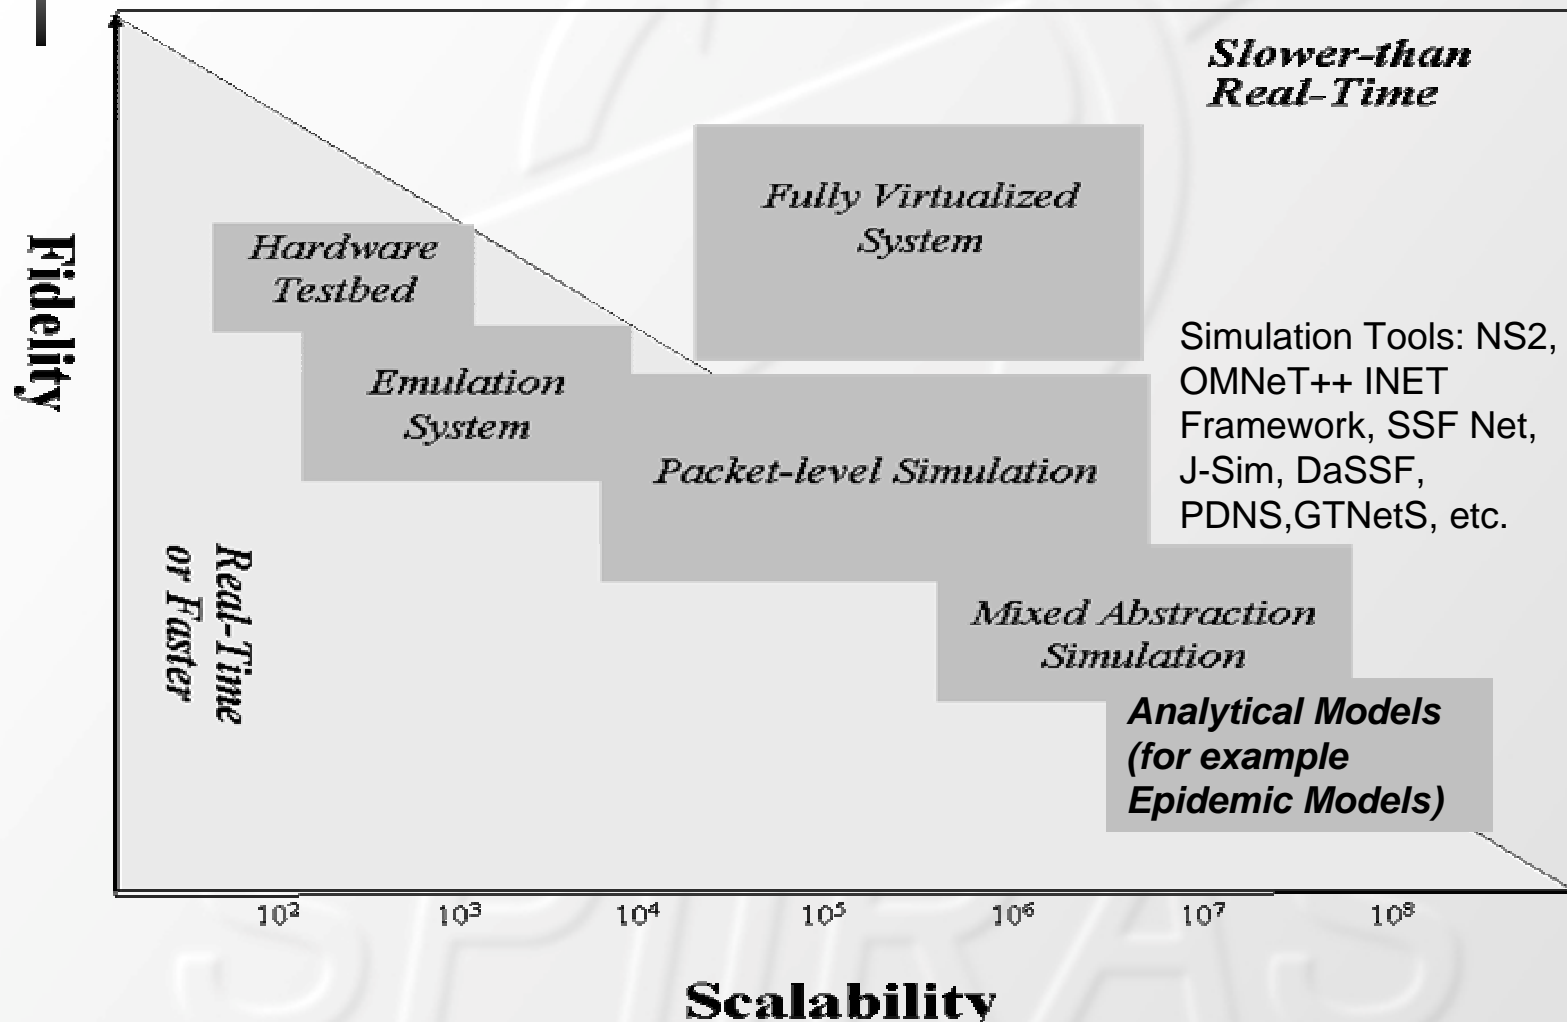

Research objectives

Development of the *formal framework, models, architecture, and software for agent-based modeling and simulation of adversarial interaction of teams of malefactors and security teams* aimed to create theoretical bases for construction of *integrated intrusion-aware trusted security systems operating in adversarial environments*.

Interaction of team of malefactors and computer network assurance system components

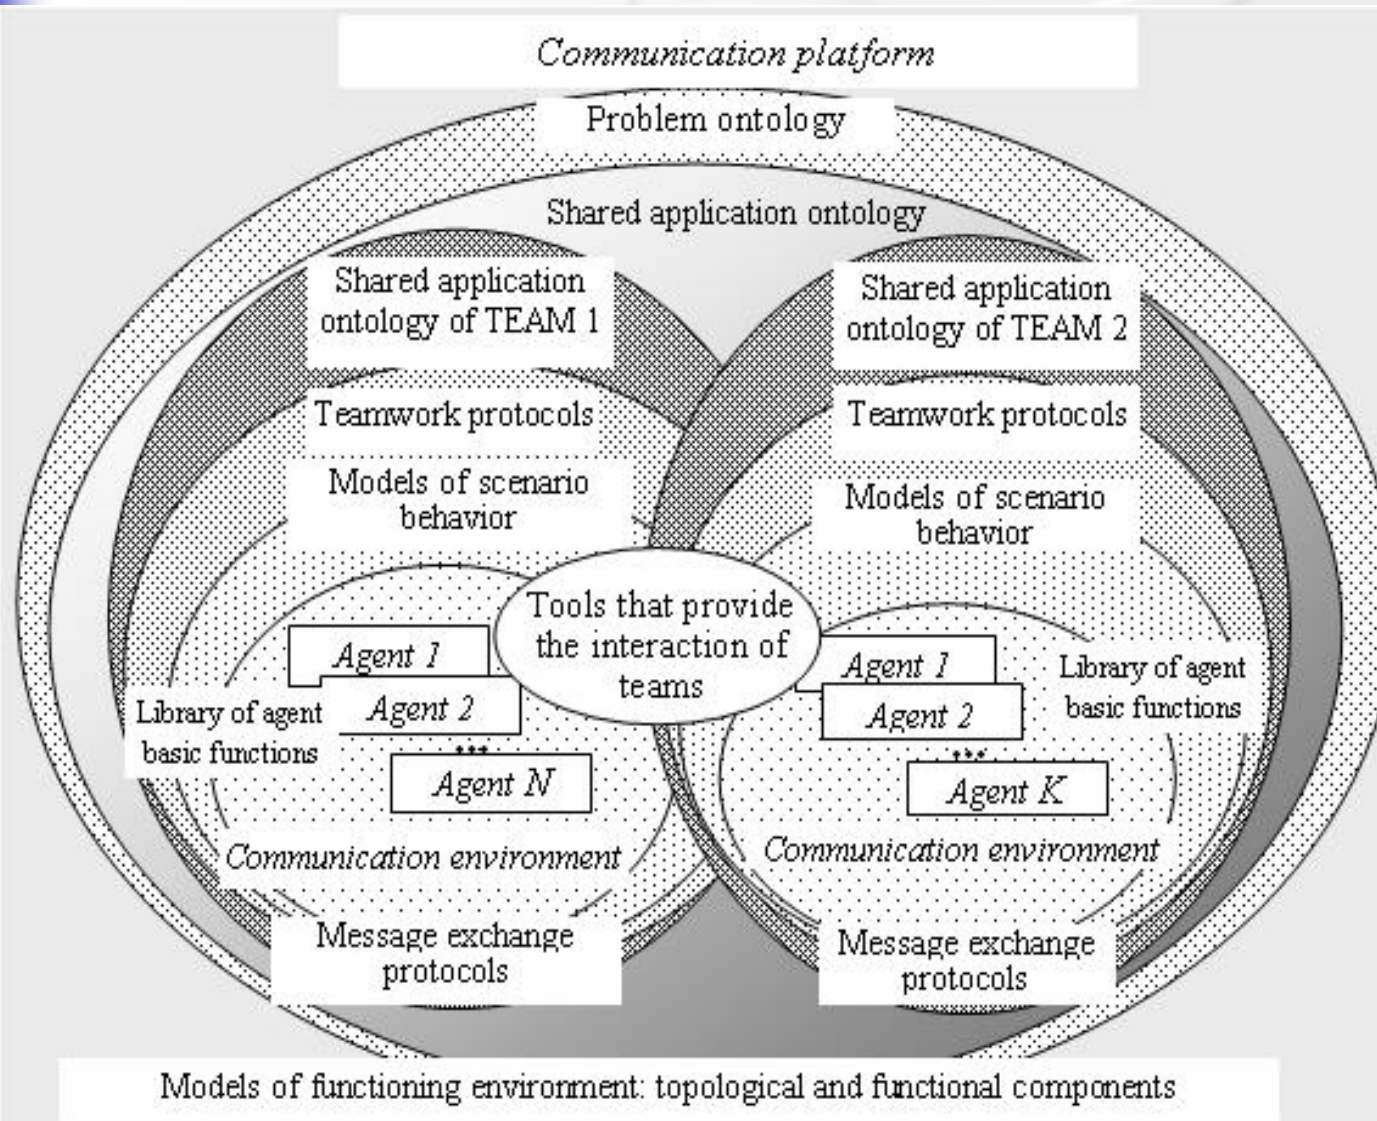

Range of Modeling Alternatives

Structure of defense team

Main Classes of Attack and Defense Parameters. Parameters of Defense Efficiency

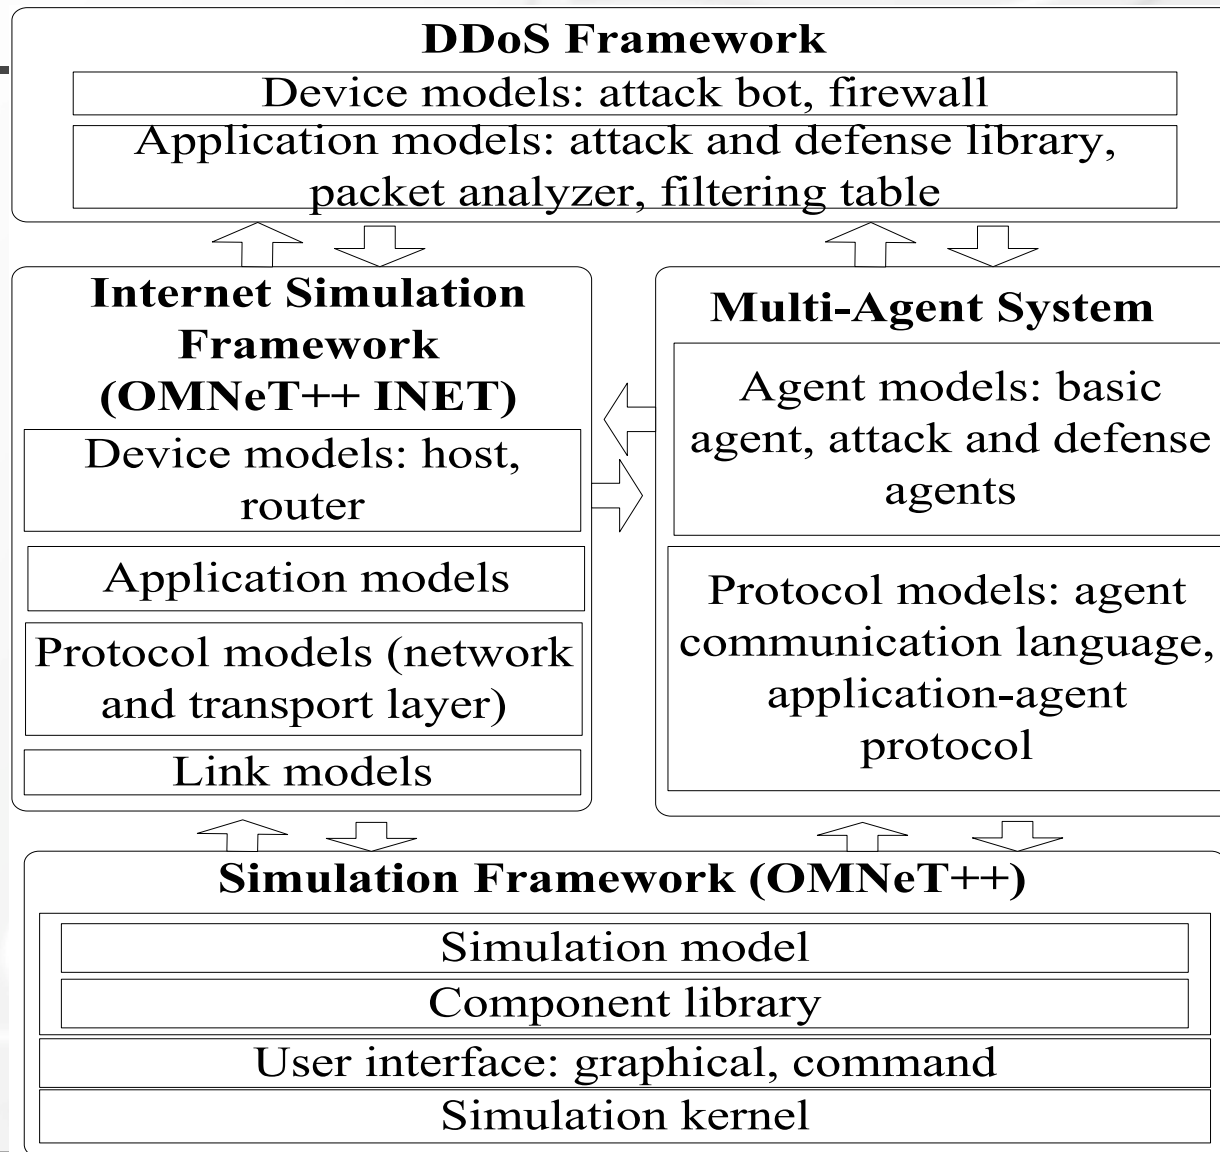

- | | Attack module |
|--|---------------|
| <ul style="list-style-type: none">• <i>Victim type</i>• <i>Attack type</i>• <i>Impact on the victim</i>• <i>Attack rate dynamics</i>• <i>Persistent of agent set</i>• <i>Possibility of exposure</i>• <i>Source address validity</i>• <i>Degree of automation</i> | |

- | Defense module | |
|--|--|
| <ul style="list-style-type: none">• <i>Deployment location</i>• <i>Mechanism of cooperation</i>• <i>Covered defense stages</i>• <i>Attack detection technique</i>• <i>Attack source detection technique</i>• <i>Attack prevention/counteraction technique</i>• <i>Model data gathering technique</i>• <i>Determination of deviation from model data</i> | |

Efficiency Parameters:

- List of detectable attacks
- Volume of the input traffic before and after filters
- Percent of the normal traffic and the attack traffic on entrance to attacked network
- Rate of dropped legitimate traffic (false positive rate)
- Rate of admitted attack traffic (false positive rate)
- Attack detection and attack reaction times
- Computational complexity
- etc.

Configuration of the Internet Fragment and Agent Teams

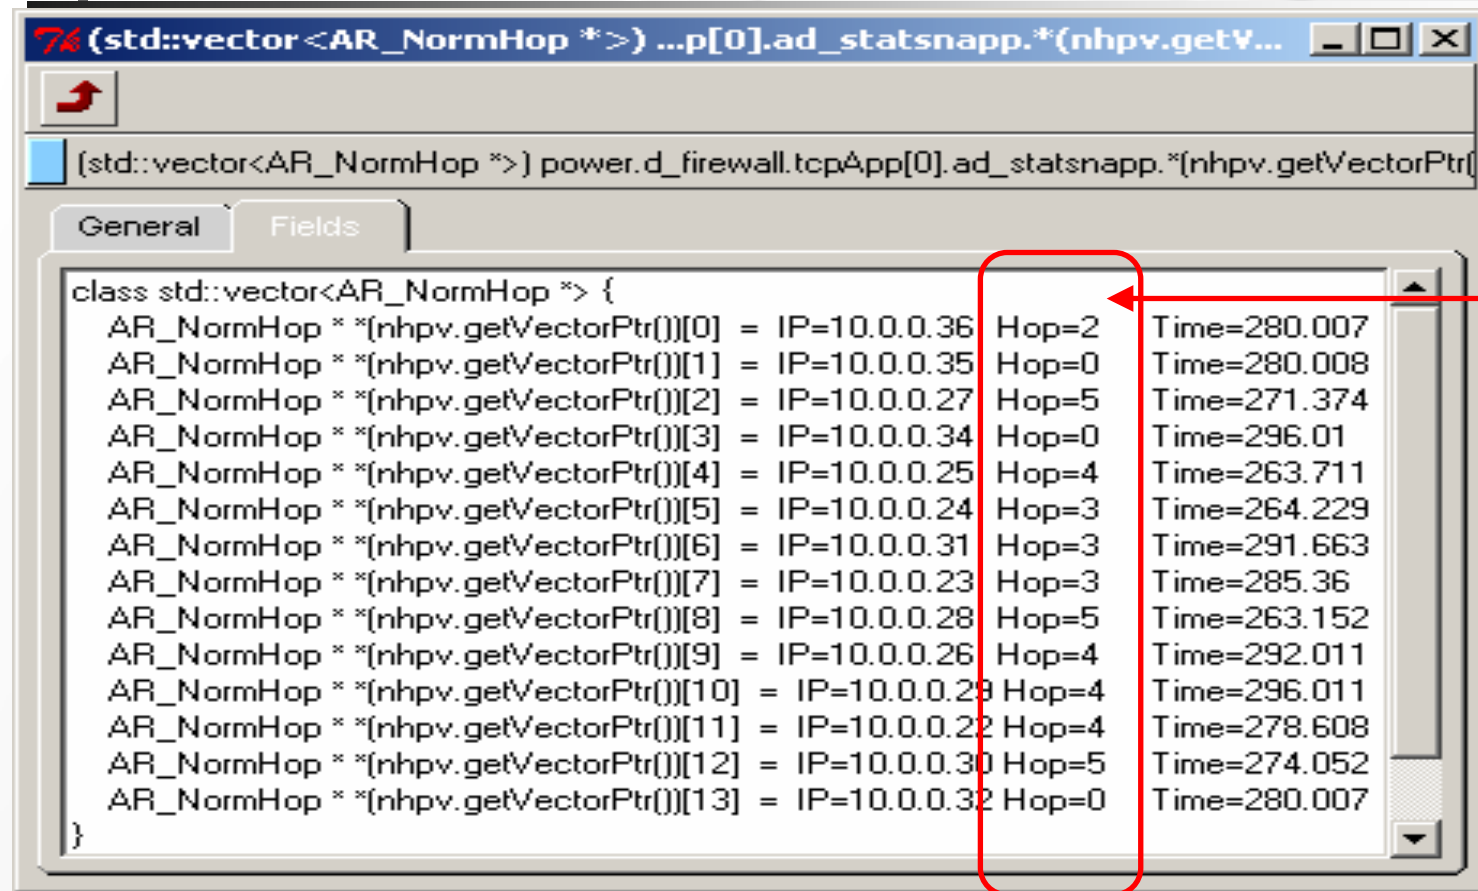

Learning Mode (1)

- The main task of learning mode is to *create the model of generic traffic for the given network*.
- *The clients* send the requests to the server and it replies.
- At this time *sampler* analyses requests and uses them to *form the models and parameters* for defense different methods.
- During the learning it is possible to watch the *change of traffic models*.

Learning Mode (2)

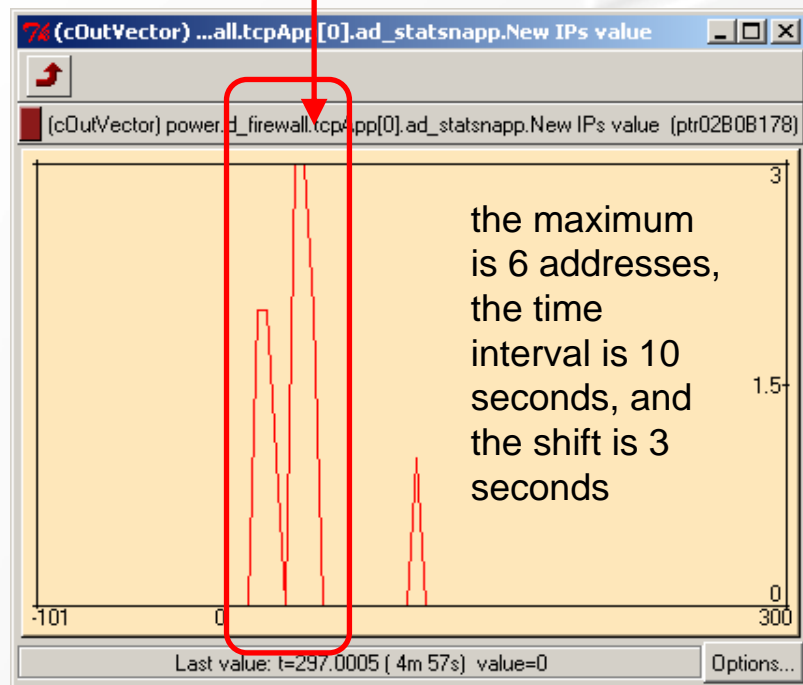

The image shows a Wireshark packet capture window. The title bar reads: `(std::vector<AR_NormHop *>) ...p[0].ad_statsnapp.*(nhpv.getV...`. The packet list pane shows a packet of type `(std::vector<AR_NormHop *>) power.d_firewall.tcpApp[0].ad_statsnapp.*(nhpv.getVectorPtr...`. The packet details pane is expanded to show the `General` tab, displaying a list of hosts and their hop counts. A red box highlights the `Hop` column, and a red arrow points to it with the text "Number of hops".

```
class std::vector<AR_NormHop *> {  
  AR_NormHop * *[nhpv.getVectorPtr()][0] = IP=10.0.0.36 Hop=2 Time=280.007  
  AR_NormHop * *[nhpv.getVectorPtr()][1] = IP=10.0.0.35 Hop=0 Time=280.008  
  AR_NormHop * *[nhpv.getVectorPtr()][2] = IP=10.0.0.27 Hop=5 Time=271.374  
  AR_NormHop * *[nhpv.getVectorPtr()][3] = IP=10.0.0.34 Hop=0 Time=296.01  
  AR_NormHop * *[nhpv.getVectorPtr()][4] = IP=10.0.0.25 Hop=4 Time=263.711  
  AR_NormHop * *[nhpv.getVectorPtr()][5] = IP=10.0.0.24 Hop=3 Time=264.229  
  AR_NormHop * *[nhpv.getVectorPtr()][6] = IP=10.0.0.31 Hop=3 Time=291.663  
  AR_NormHop * *[nhpv.getVectorPtr()][7] = IP=10.0.0.23 Hop=3 Time=285.36  
  AR_NormHop * *[nhpv.getVectorPtr()][8] = IP=10.0.0.28 Hop=5 Time=263.152  
  AR_NormHop * *[nhpv.getVectorPtr()][9] = IP=10.0.0.26 Hop=4 Time=292.011  
  AR_NormHop * *[nhpv.getVectorPtr()][10] = IP=10.0.0.29 Hop=4 Time=296.011  
  AR_NormHop * *[nhpv.getVectorPtr()][11] = IP=10.0.0.22 Hop=4 Time=278.608  
  AR_NormHop * *[nhpv.getVectorPtr()][12] = IP=10.0.0.30 Hop=5 Time=274.052  
  AR_NormHop * *[nhpv.getVectorPtr()][13] = IP=10.0.0.32 Hop=0 Time=280.007  
}
```

List of hosts that sent requests to server and hops to them after 300 sec of learning

Learning Mode (3)

many new addresses in the beginning

Change of new IP addresses amount

many new addresses in the interval between 0 and 50 seconds

```

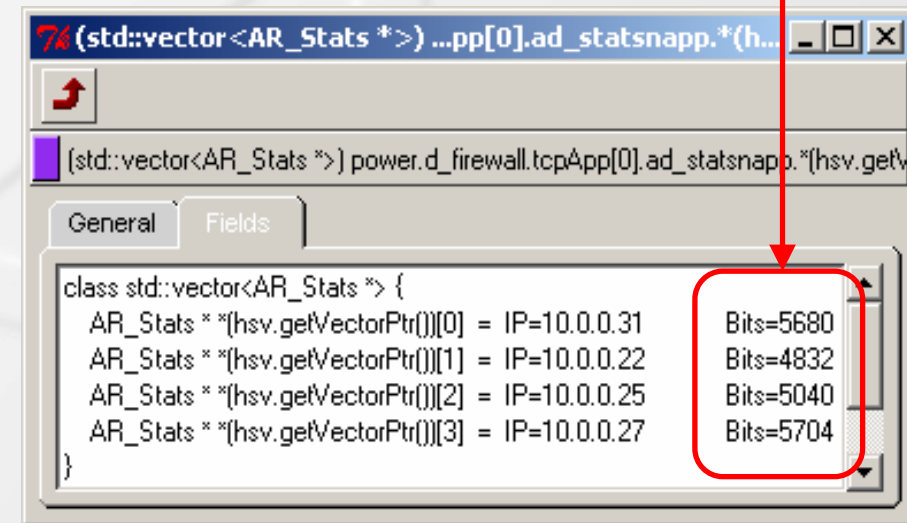

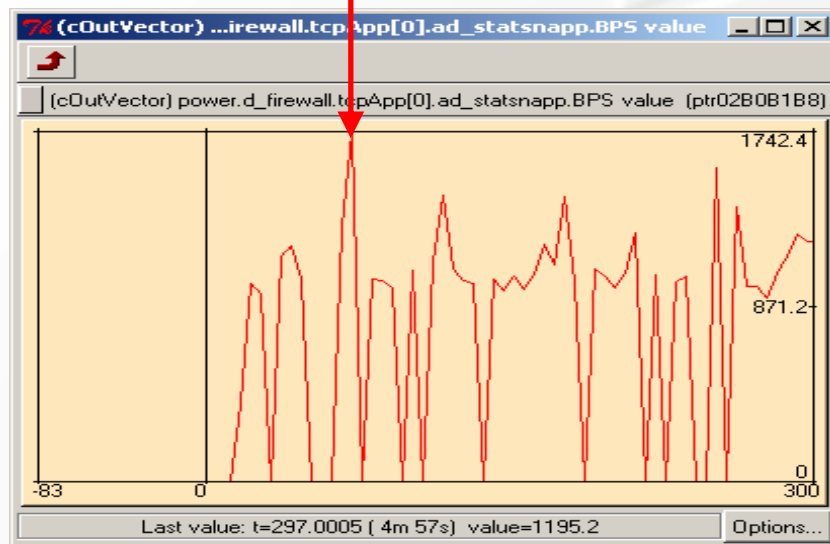

class std::vector<AR_NormIP *> {
  AR_NormIP * *[nipv.getVectorPtr()][0] = IP=10.0.0.33   Time=12.0008
  AR_NormIP * *[nipv.getVectorPtr()][1] = IP=10.0.0.36   Time=14.0003
  AR_NormIP * *[nipv.getVectorPtr()][2] = IP=10.0.0.37   Time=14.0001
  AR_NormIP * *[nipv.getVectorPtr()][3] = IP=10.0.0.25   Time=23.1377
  AR_NormIP * *[nipv.getVectorPtr()][4] = IP=10.0.0.27   Time=21.9945
  AR_NormIP * *[nipv.getVectorPtr()][5] = IP=10.0.0.35   Time=21.9947
  AR_NormIP * *[nipv.getVectorPtr()][6] = IP=10.0.0.24   Time=32.034
  AR_NormIP * *[nipv.getVectorPtr()][7] = IP=10.0.0.23   Time=35.1563
  AR_NormIP * *[nipv.getVectorPtr()][8] = IP=10.0.0.31   Time=33.8222
  AR_NormIP * *[nipv.getVectorPtr()][9] = IP=10.0.0.28   Time=37.3439
  AR_NormIP * *[nipv.getVectorPtr()][10] = IP=10.0.0.26  Time=39.8259
  AR_NormIP * *[nipv.getVectorPtr()][11] = IP=10.0.0.29  Time=39.925
  AR_NormIP * *[nipv.getVectorPtr()][12] = IP=10.0.0.22  Time=42.0896
  AR_NormIP * *[nipv.getVectorPtr()][13] = IP=10.0.0.30  Time=45.5916
  AR_NormIP * *[nipv.getVectorPtr()][14] = IP=10.0.0.32  Time=100.002
}
  
```

List of clients requested server and considered as legitimate after 300 sec of learning

Learning Mode (4)

The maximum value was
1742.4 bit/s

Values of bits in
interval 10 seconds

Change of BPS (bit per
second) parameter

Values of transmitted bits for different
hosts

Decision Making and Acting (1)

- Normal work (interval 0 – 300 seconds)
- Defense team: Formation, start using BPS method
- Attack team: Formation
- Attack team: After 300 seconds - begins the attack actions (intensity of attack for every daemon - 0.5, **no IP spoofing**)
- Defense team: data processing, attack detecting (**using BPS**) and reacting (interval 300 – 350 seconds)
- Defense team: blocking the attack, destroying some attack agents (interval 300 – 600 seconds)

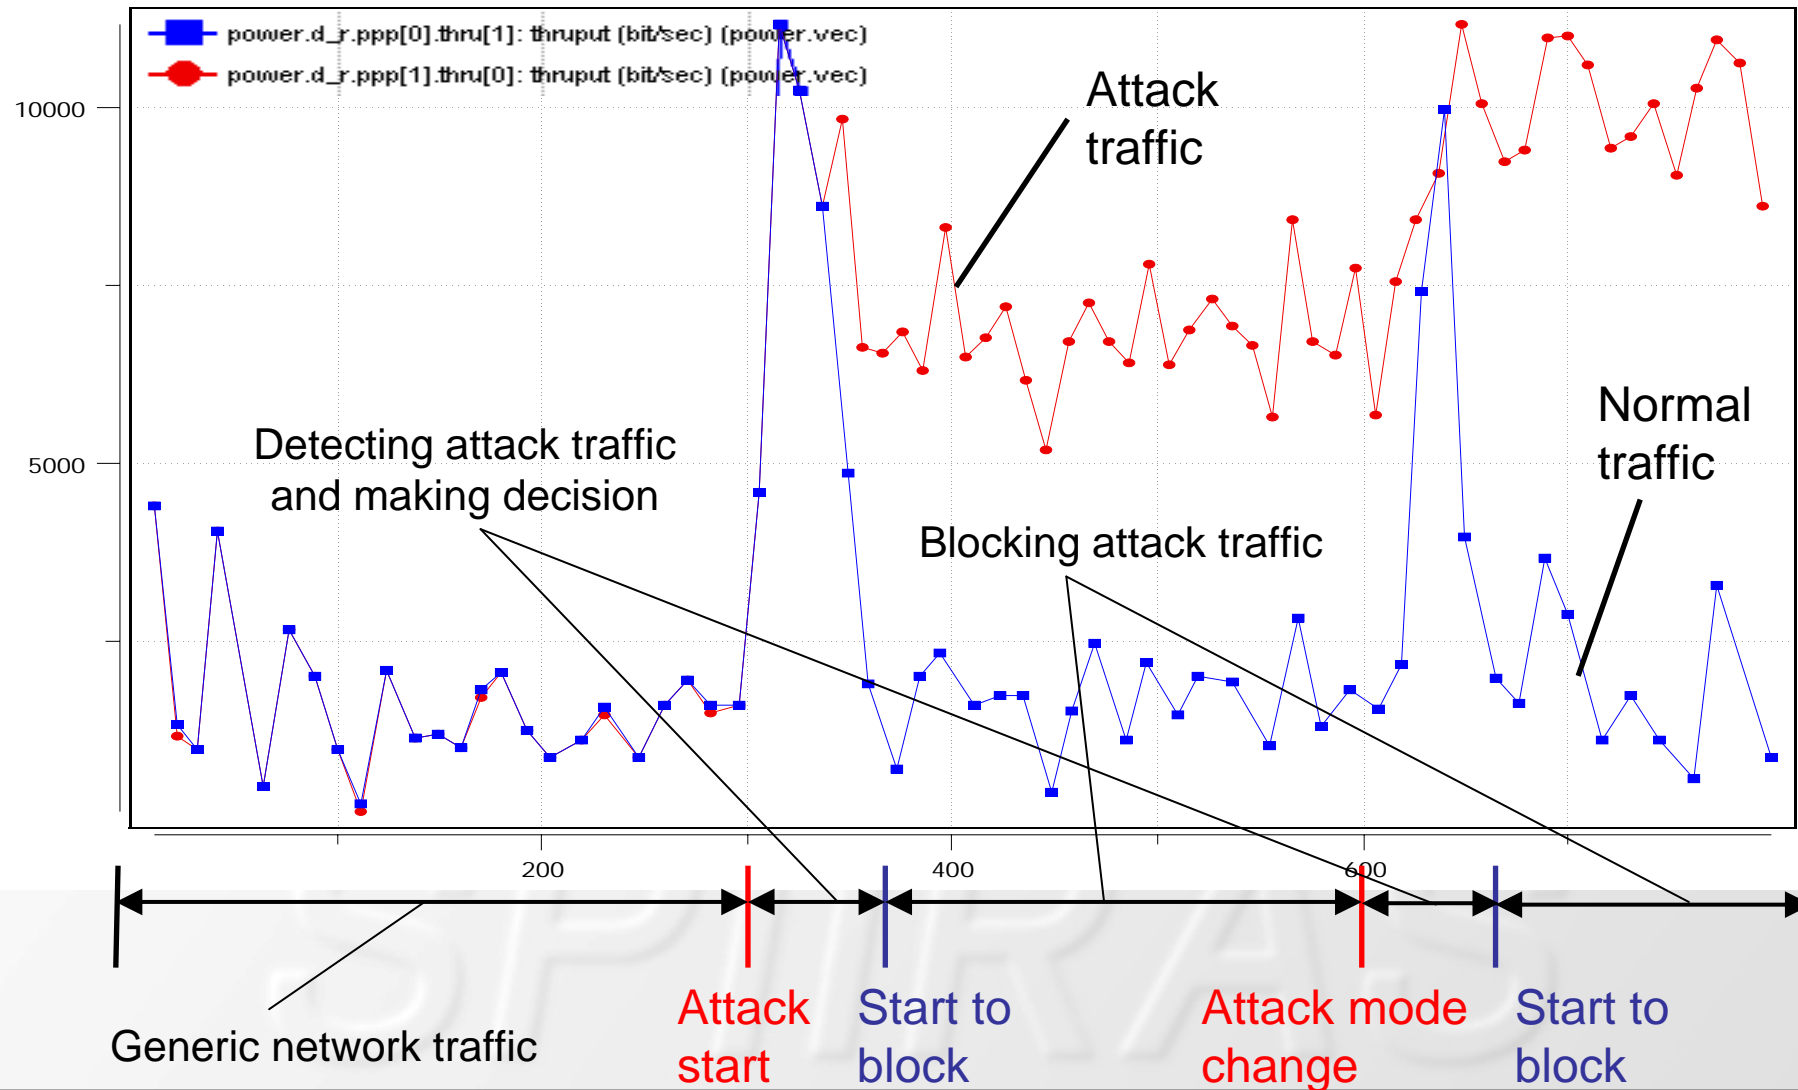

Decision Making and Acting (2)

- Attack team: After 600 seconds - **automatic adaptation** (redistributing the intensity of attack (0.83), changing the method of **IP spoofing (Random)**)
- Defense team: data processing, failing to detect the attack (**using BPS method**) – Detector sees that the input channel throughput has noticeably lowered, but does not receive any anomaly report from sampler because BPS does not work.
- Defense team: Changing defense method on **SIPM (automatic adaptation)**.
- Defense team: data processing, attack detecting (**using SIPM method**) and reacting – (interval 600 – 700 seconds)
-

Scheme of Acting

Graphs of channel throughput

Cooperation between defense teams

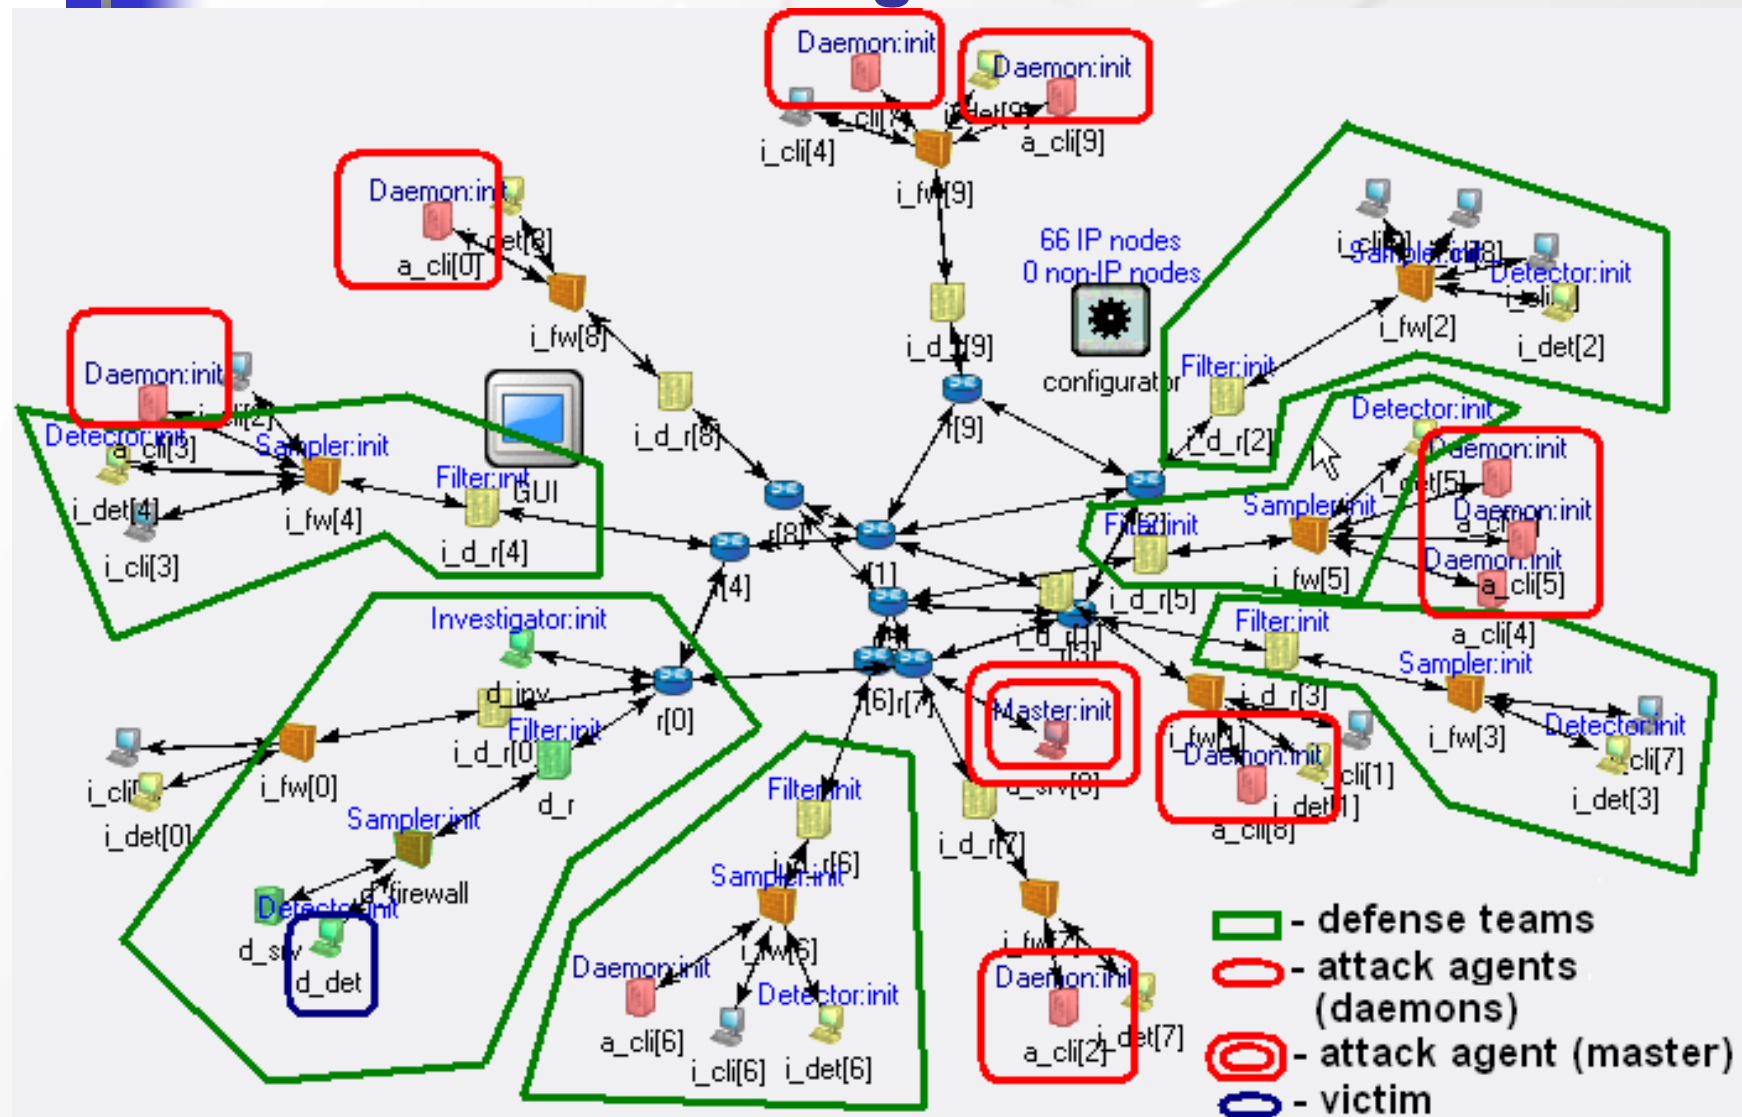

Models of cooperation between distributed defense teams:

- (1) filter-level cooperation***
- (2) sampler-level cooperation***
- (3) “poor” cooperation:***
- (4) “full” cooperation***

Such cooperation schemas are used in the cooperative DDoS defense methods:

COSSACK, Perimeter-based DDoS defense, DefCOM, Gateway-based, ACC pushback, MbSQD, SOS, tIP router architecture, etc.)

- **Security analysis of computer networks**

SPIIRAS

High Level Task Representation

Main features of the Approach

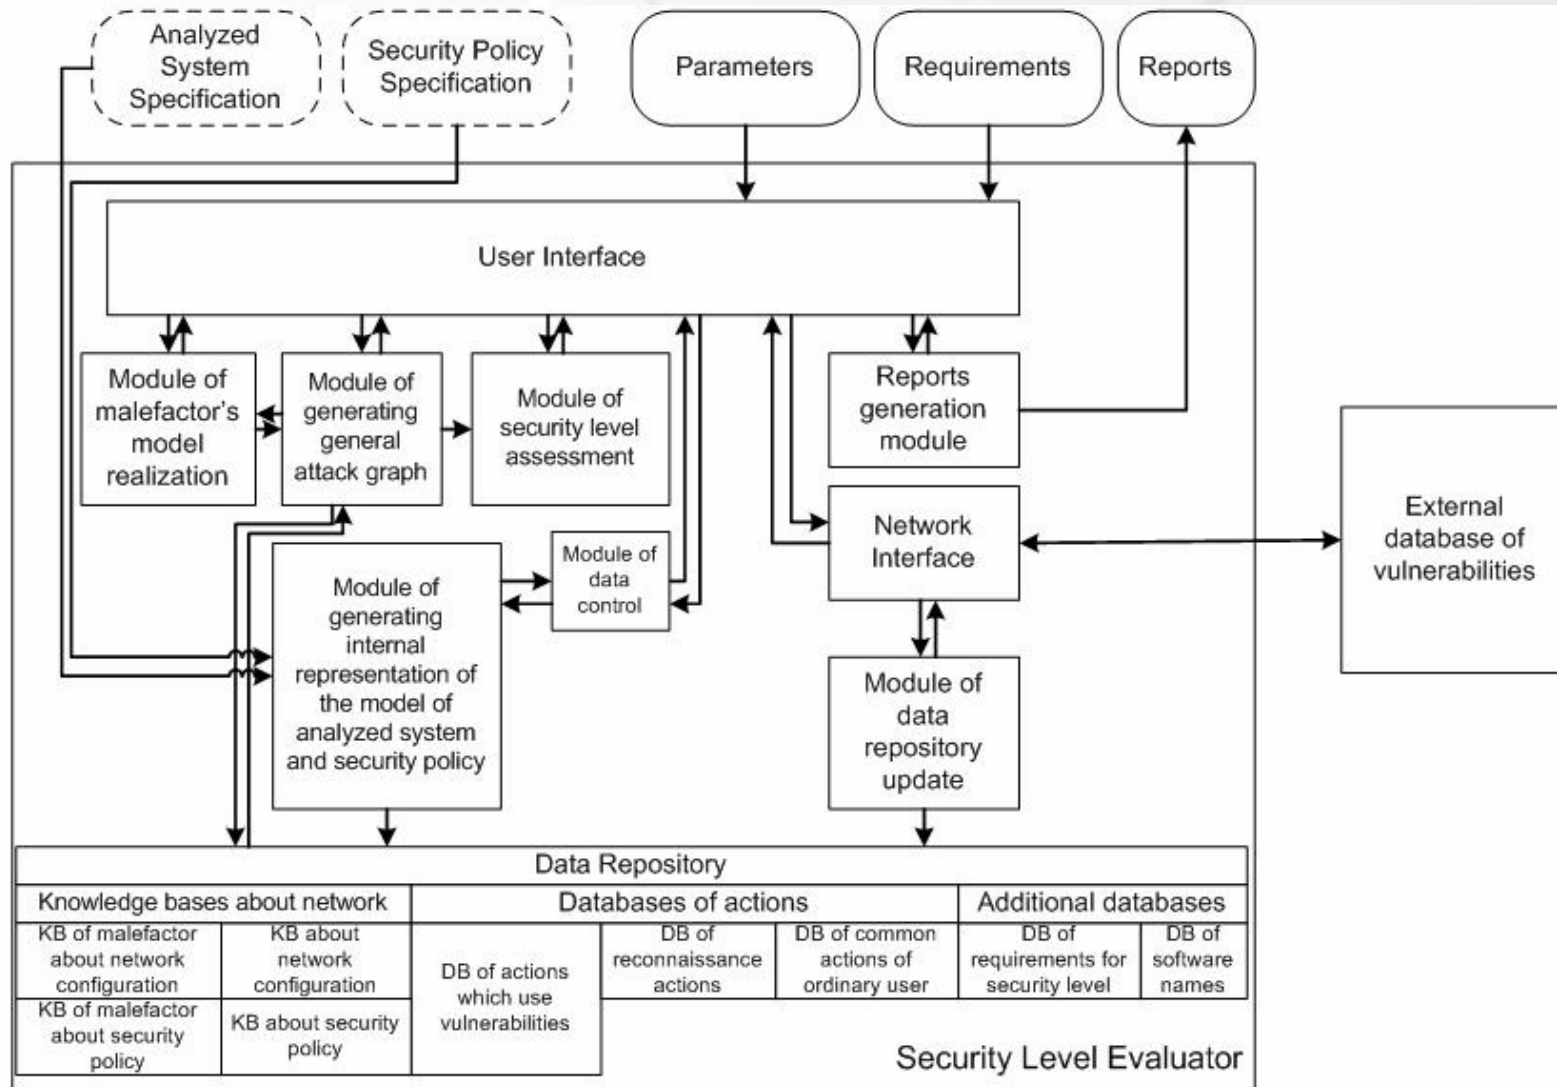

- Based on **malefactor's action simulation** and integrated family of various **expert knowledge models**
- **Two main phases:**
 - (1) construction of attack graph and
 - (2) computation of different security metrics using combination of qualitative techniques of risk analysis
- Taking into account **diversity of malefactor's positions, intentions and experience;**
- Estimating the influence of **different configuration and policy data;**
- Taking into account not only **attack actions** (which use vulnerabilities), but the common actions of legitimate users and reconnaissance actions;

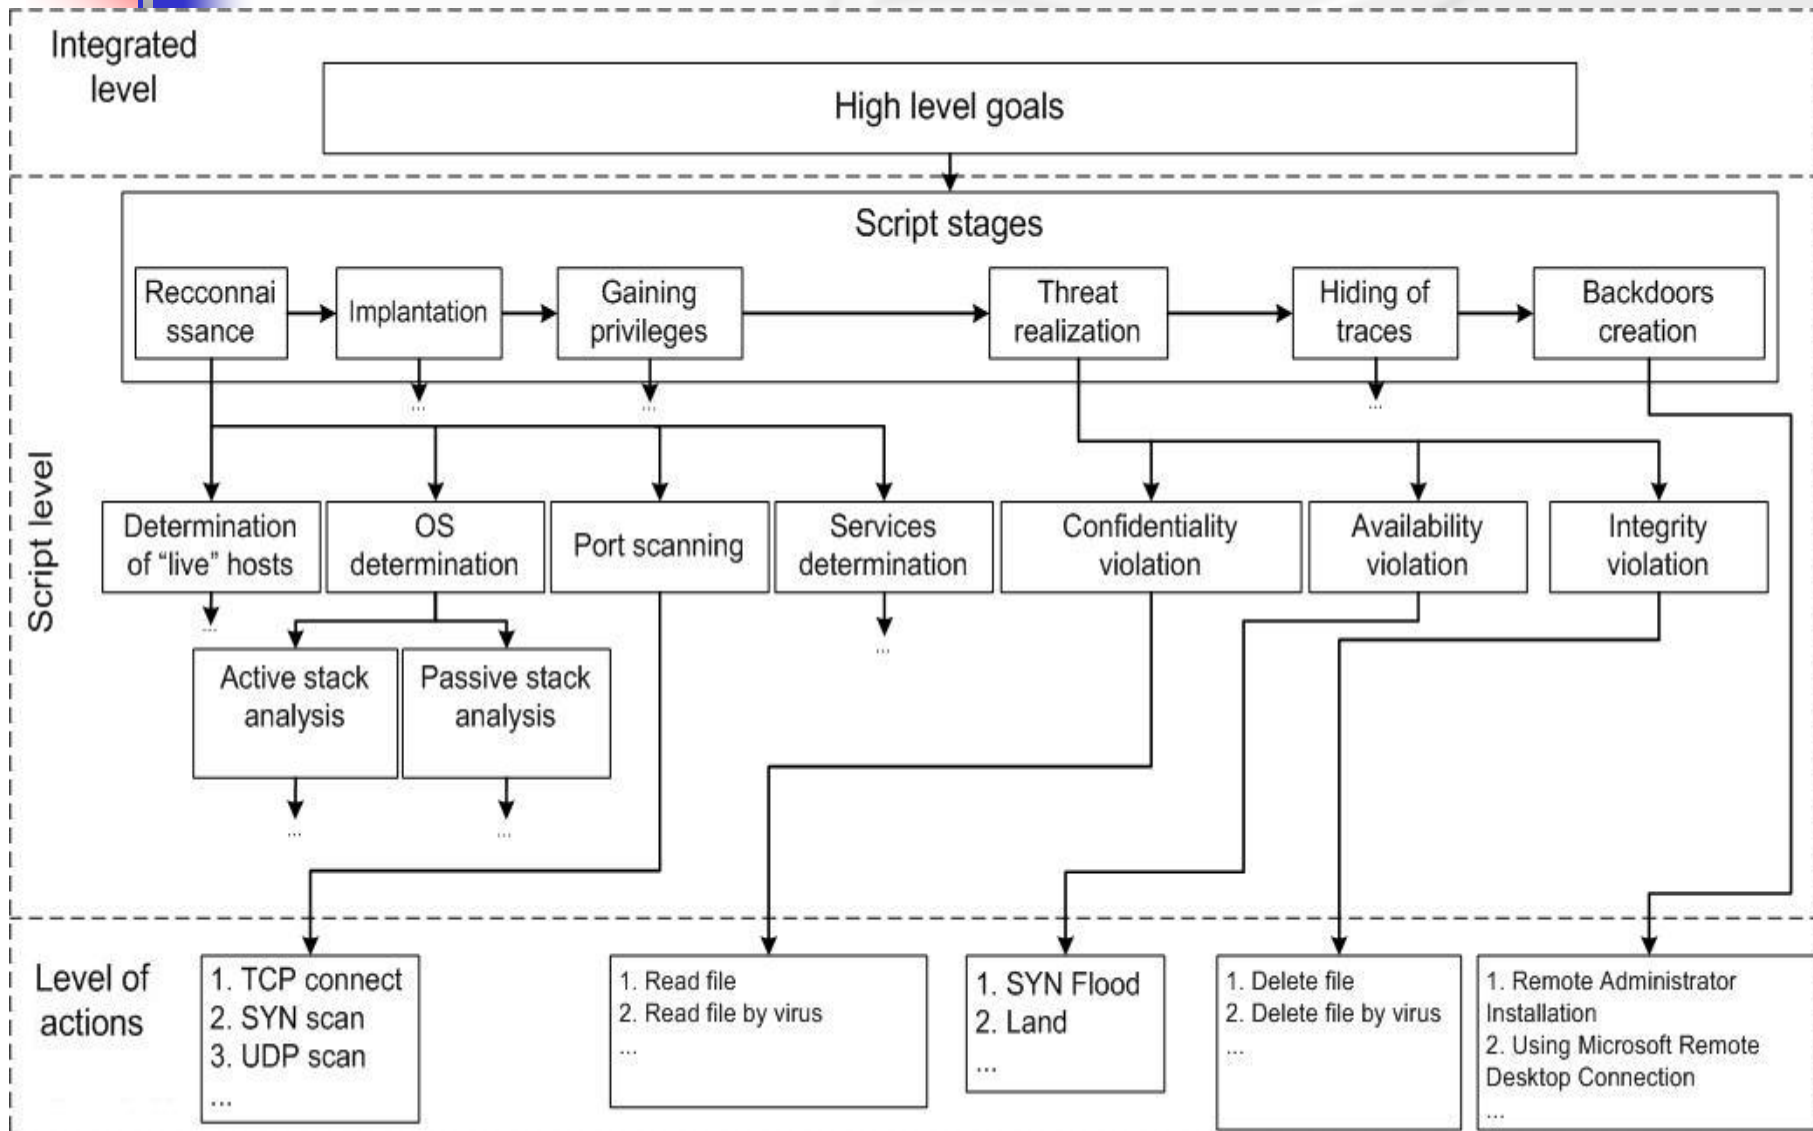

Main features of the Approach (cont'd)

- Investigation of various threats for different resources;
- Detection of “weak” places;
- Usage of up to date databases of vulnerabilities (NVD, OSVDB);
- The “CVSS. Common Vulnerability Scoring System” approach is used for computation of a part of primary security metrics;
- Comparing calculated metrics and user requirements
- The qualitative techniques of risk analysis are used for computation of security metrics (in particular SANS/GIAC and FRAP technique).

Generalized Architecture

Generalized Attack Scenarios

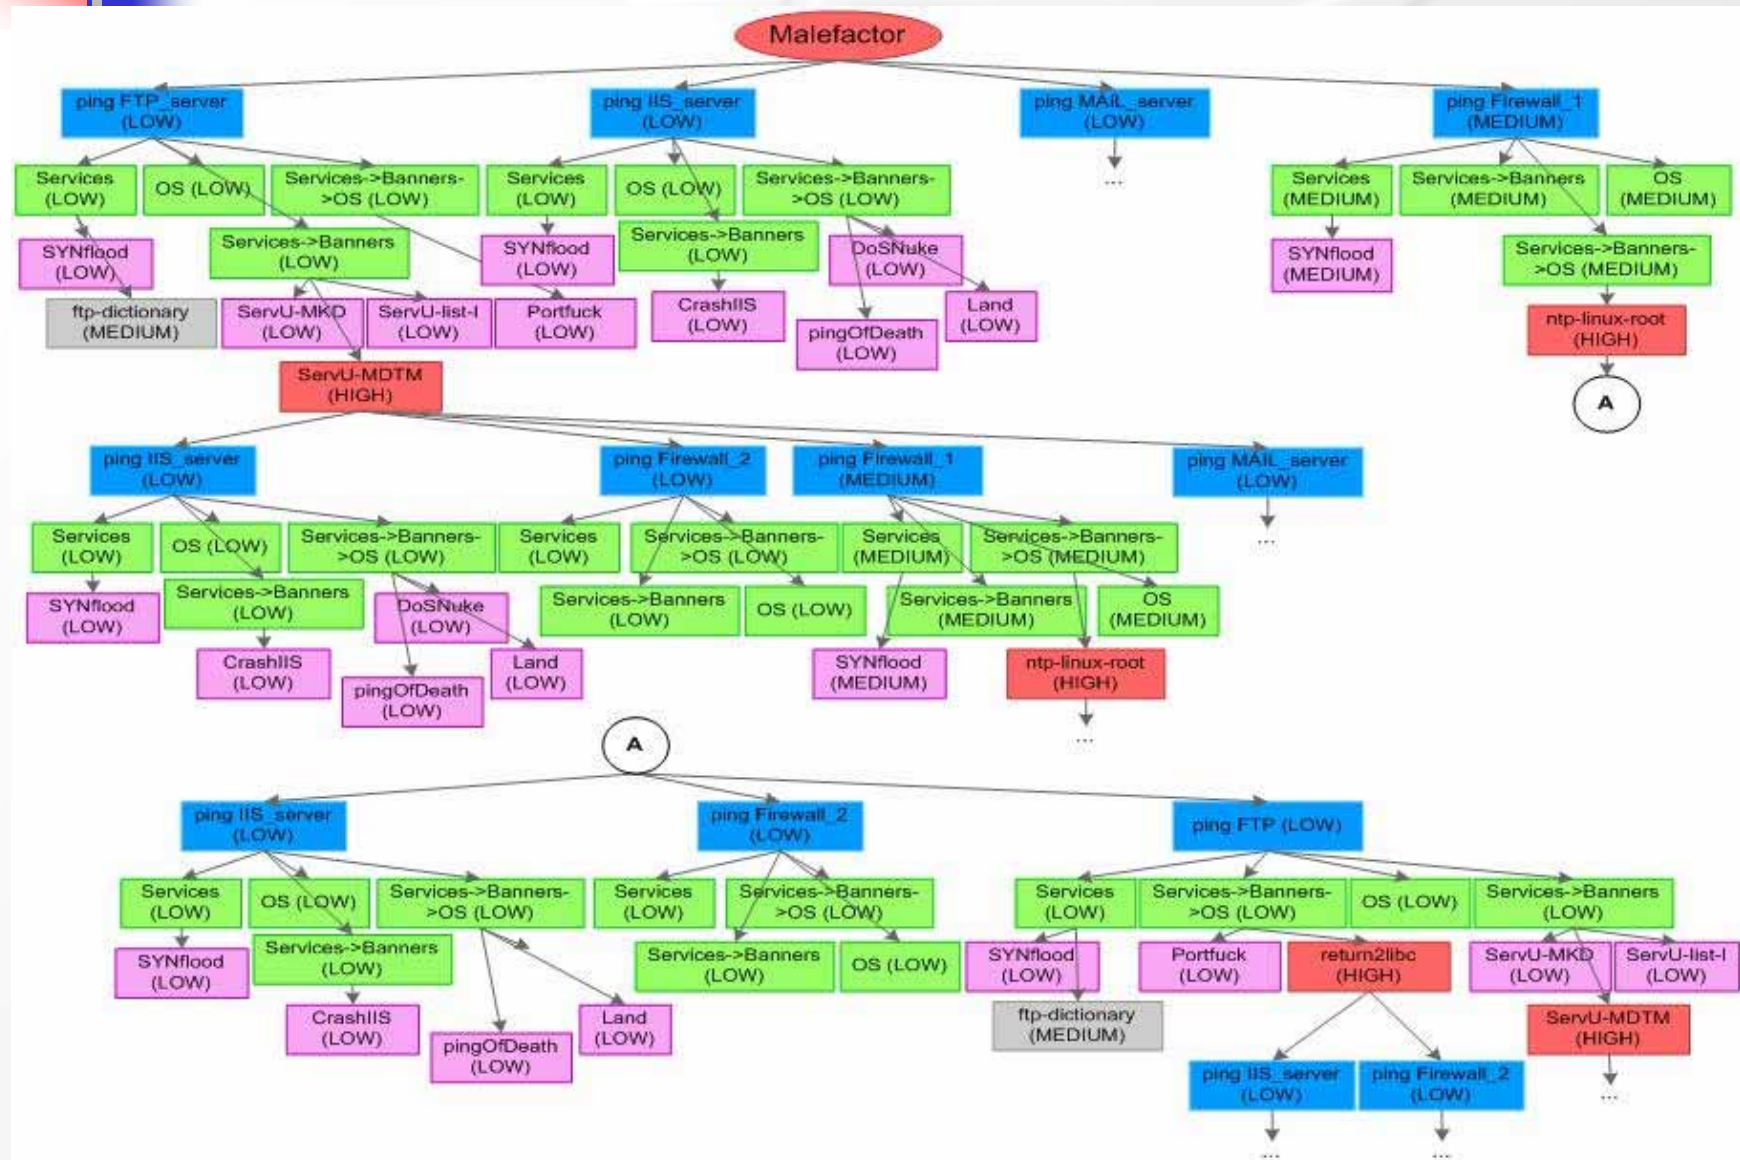

Generating Common Attack Graph

- **Realization of actions which are intended for malefactor's movement from one host onto another in the following cases:**
 - There is a possibility to realize the attack actions which use vulnerabilities of software and hardware and which require that the malefactor already have the privileges of local user
 - Movement of the malefactor into the attacked host allows him to penetrate the another segment of network
 - Movement of the malefactor into attacked host allows him to use "trust relationships"
- **Realization of reconnaissance actions for detection of "live" hosts (ex., "ping" utility)**
- **Realization of reconnaissance scenarios (the sets of actions) for each of the detected hosts (ex, "nmap OS", "nmap services", "banners")**
- **Realization of attack actions which use vulnerabilities of software and hardware, and common actions of ordinary users**

Example: Attack Graph

Model of Security Level Evaluation

Model of Security Level Evaluation consists of:

- Security metrics
- Rules (formulas) for their calculation

Two approaches for security level evaluation:

- Qualitative express assessment (!)
- Quantitative computation

Taxonomy of Security Metrics (SM)

- According to division of objects of attack graph
 - SM of base objects (hosts, attack actions)
 - SM of complex objects (routes, threats, graph)
- According to the order of calculation
 - Primary (received directly from attack graph)
 - Secondary (calculated on the basis of primary)
- Whether metrics are used for evaluation of general security level
 - Basic (are used for evaluation of general security level)
 - Auxiliary (are not used for evaluation of general security level)

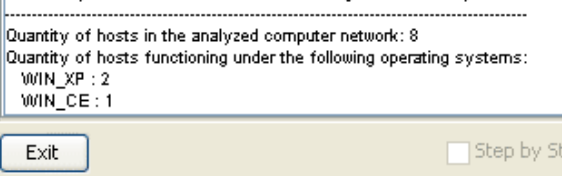

Basic Security Metrics

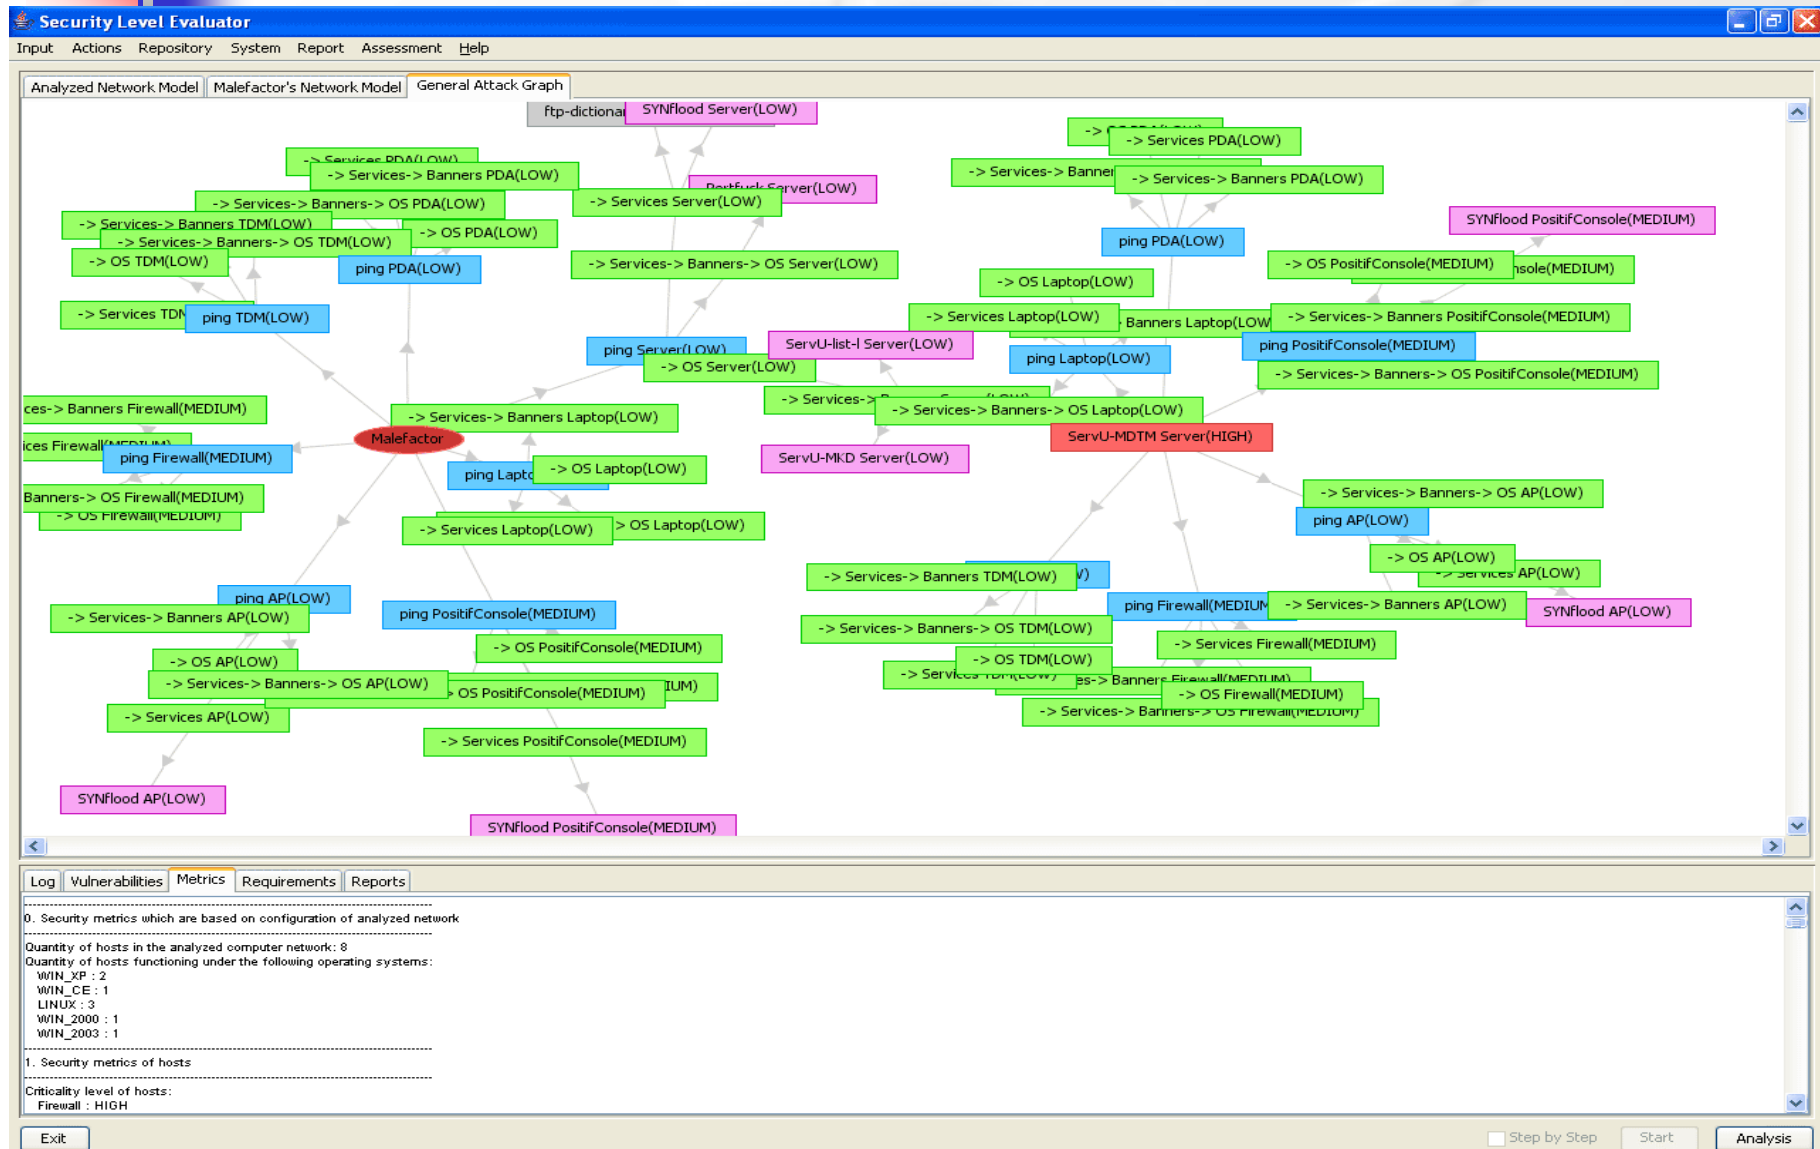

- Criticality Level of the host **Criticality(h)**
- Criticality Level of attack action **Severity(a)**
- Damage Level of attack action **Mortality(a,h)**
- Damage Level of route **Mortality(S)** or threat **Mortality(T)**
- Access Complexity Level **AccessComplexity(a)**,
AccessComplexity(S), **AccessComplexity(T)**
- Admissibility of threat realization **Realization(T)**
- Risk Level of threat **RiskLevel(T)**
- General Security Level of network **SecurityLevel**

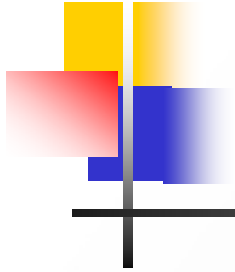

Technique of General Security Level Evaluation

- Calculation of security metrics of basic and complex objects
- Estimation of qualitative risk level for all threats
- Evaluation of security level of analyzed computer network on basis of received values of risk levels for threats

Implementation: User Interface (2)

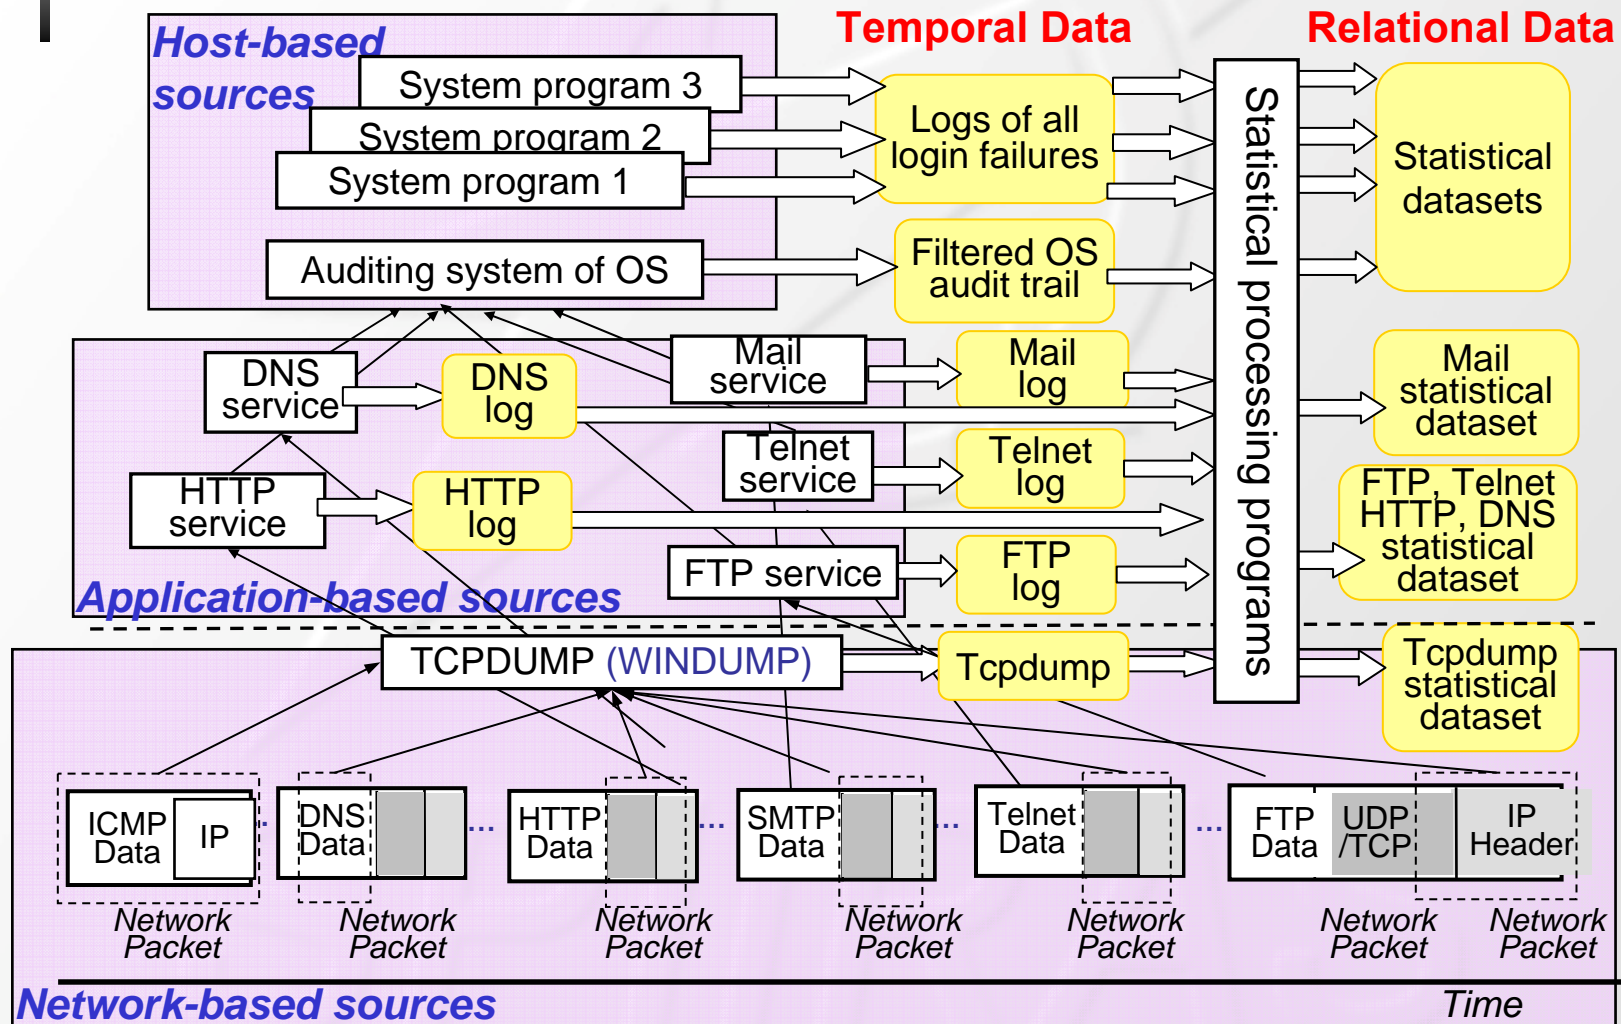

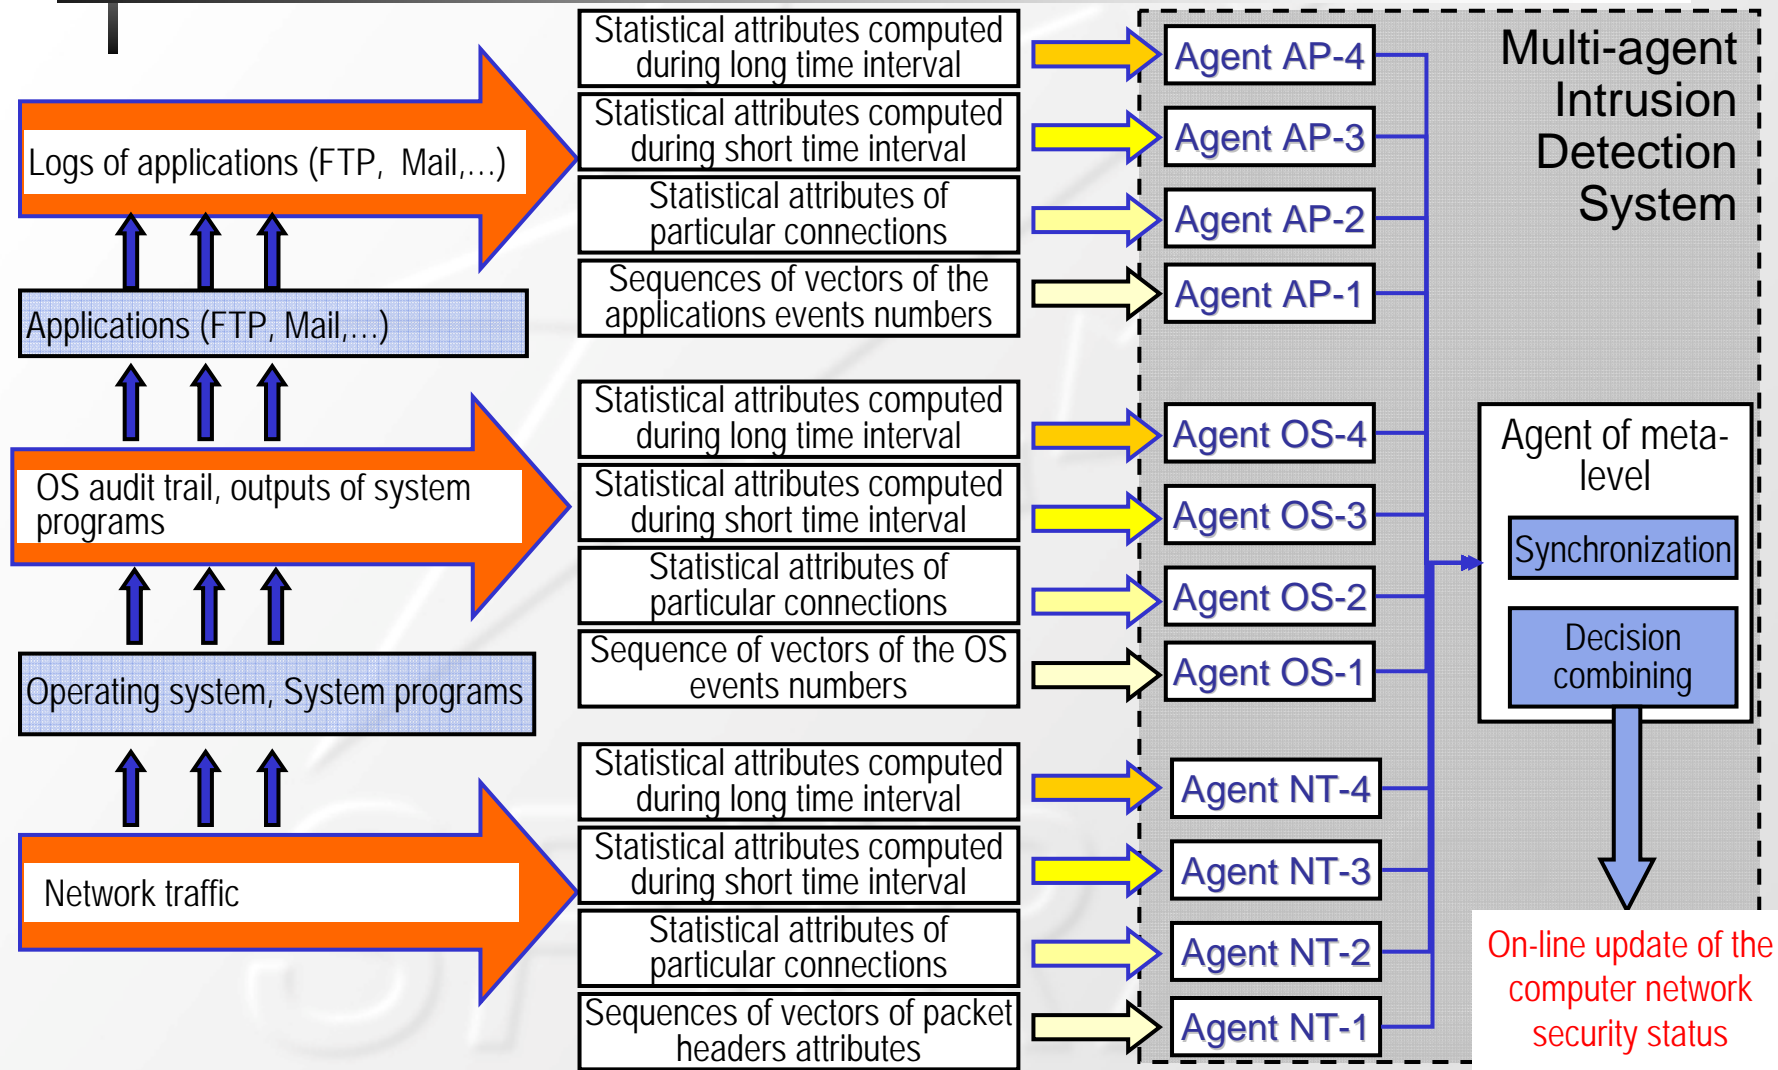

- **Intrusion detection**

SPIIRAS

Different Sources of information

Multi-agent Architecture of Raw Data Preprocessing and Intrusion Detection

Case Study: Anomaly Detection in Computer Network

Computer security status: {*Normal* , *Abnormal*}.

Types of attacks constituting class "*Abnormal*": {Probing, Remote to local (R2L); Denial of service (DOS) and User to root (U2R)}.

Instances of attacks of respective classes: {SYN-scan, FTP-crack attack, SYN flood, and PipeUpAdmin}.

Information Source: Network traffic raw data.

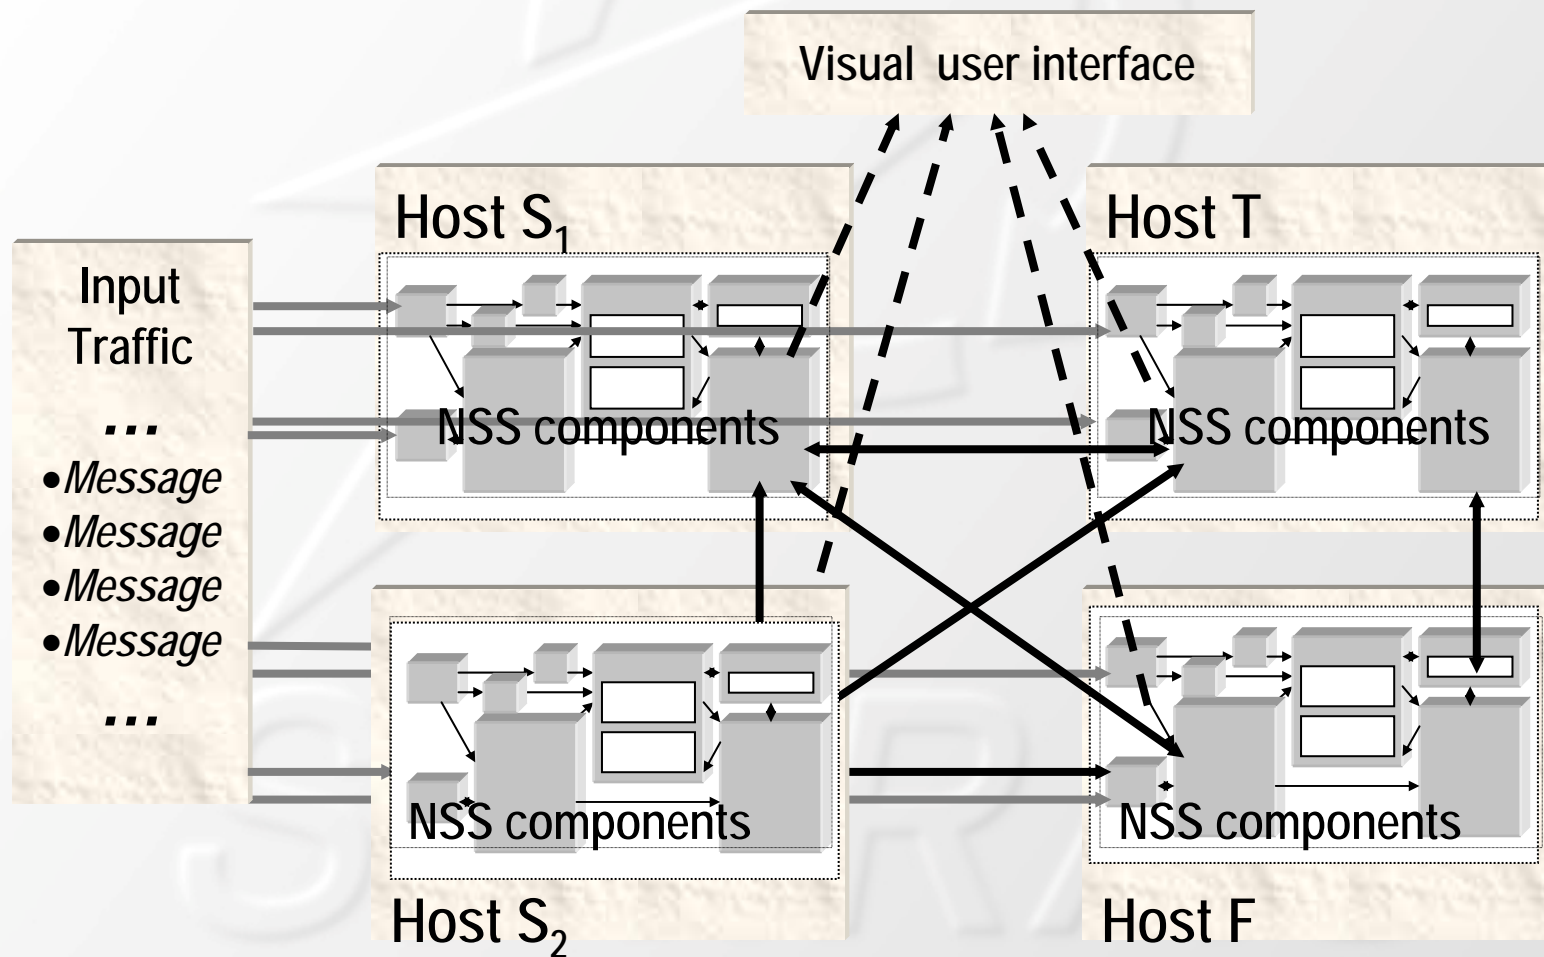

Data source 1: *Stream of binary vectors* specifying stream of headers of IP packets within a connection (sequence of binary vectors).

Data source 2: *Statistical attributes of particular connections manifesting in input traffic*. (duration, status, total number of connection packets and also other attributes specifying statistics of connections).

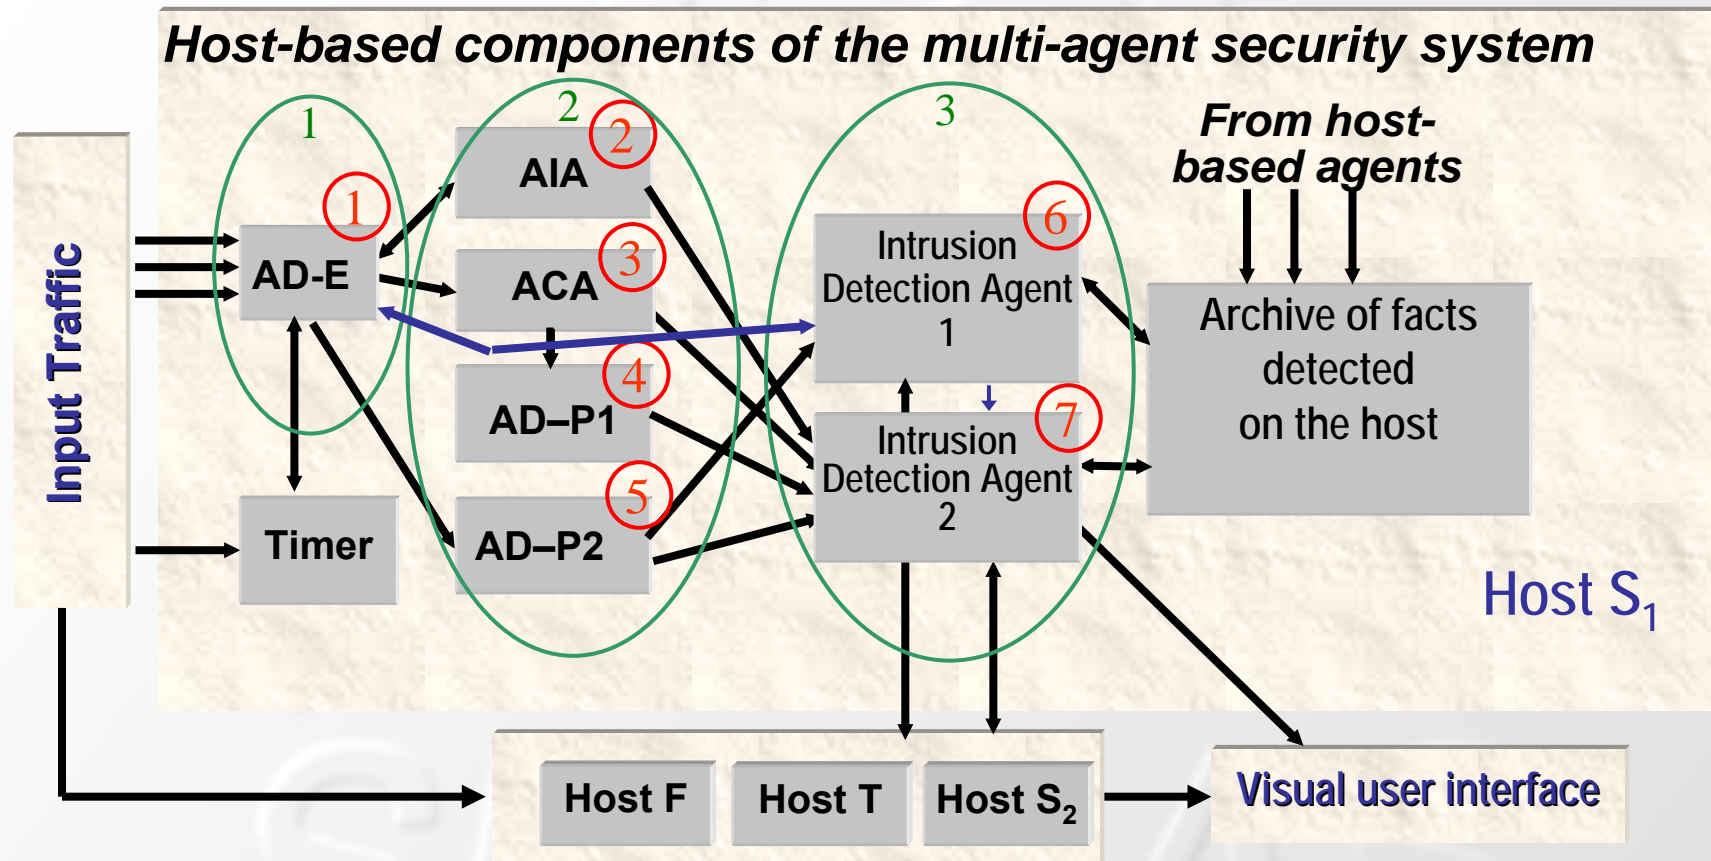

Data source 3: *Statistical attributes of traffic during the short time (5 sec) intervals* (four features specifying integral characteristics of input traffic-- numbers of connections and services of different types during last 5 sec).

Data source 4: *Statistical attributes of traffic for long time intervals* (composed of the same statistics as previous ones averaged over 100 connections).

SPIIRAS

Workflow of security policy specification and checking

Architecture of security policy verification system

Examples of Verification Modules

- **Event Calculus verification module**

- security policies and system description are translated into domain-dependent Event Calculus axiomatic
- conflict predicates are introduced
- abductive inference is used for conflict detection
- *Implemented in Jess*

- **SPIN verification module**

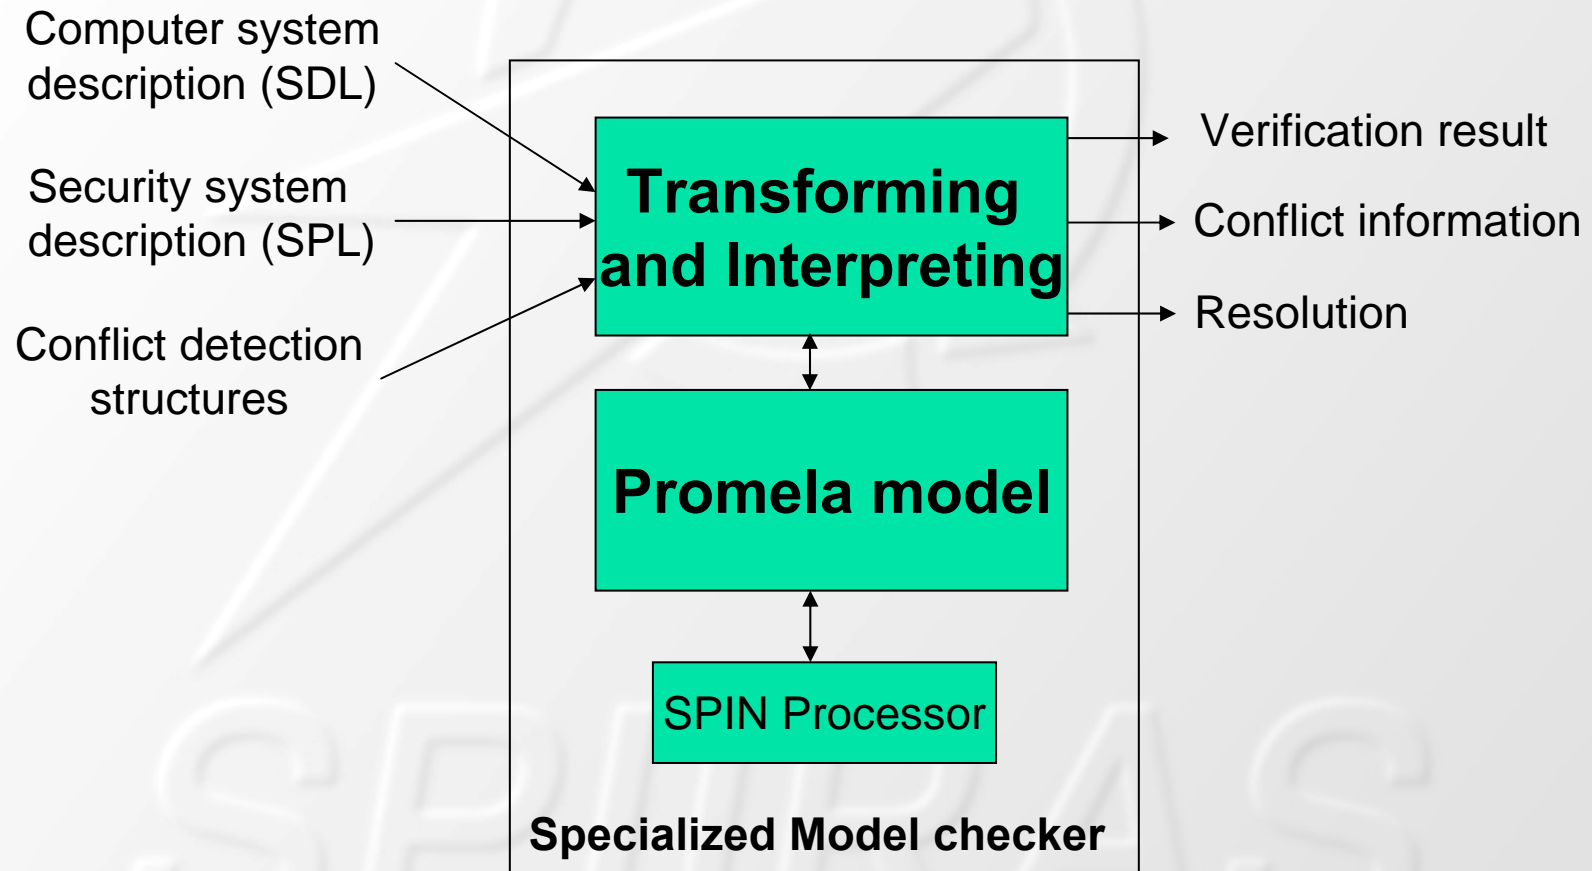

- security policies and system description are translated into Promela data structures, processes, and assertions
- policy conflicts introduced as additional assertions
- *implemented in SPIN-Promela*

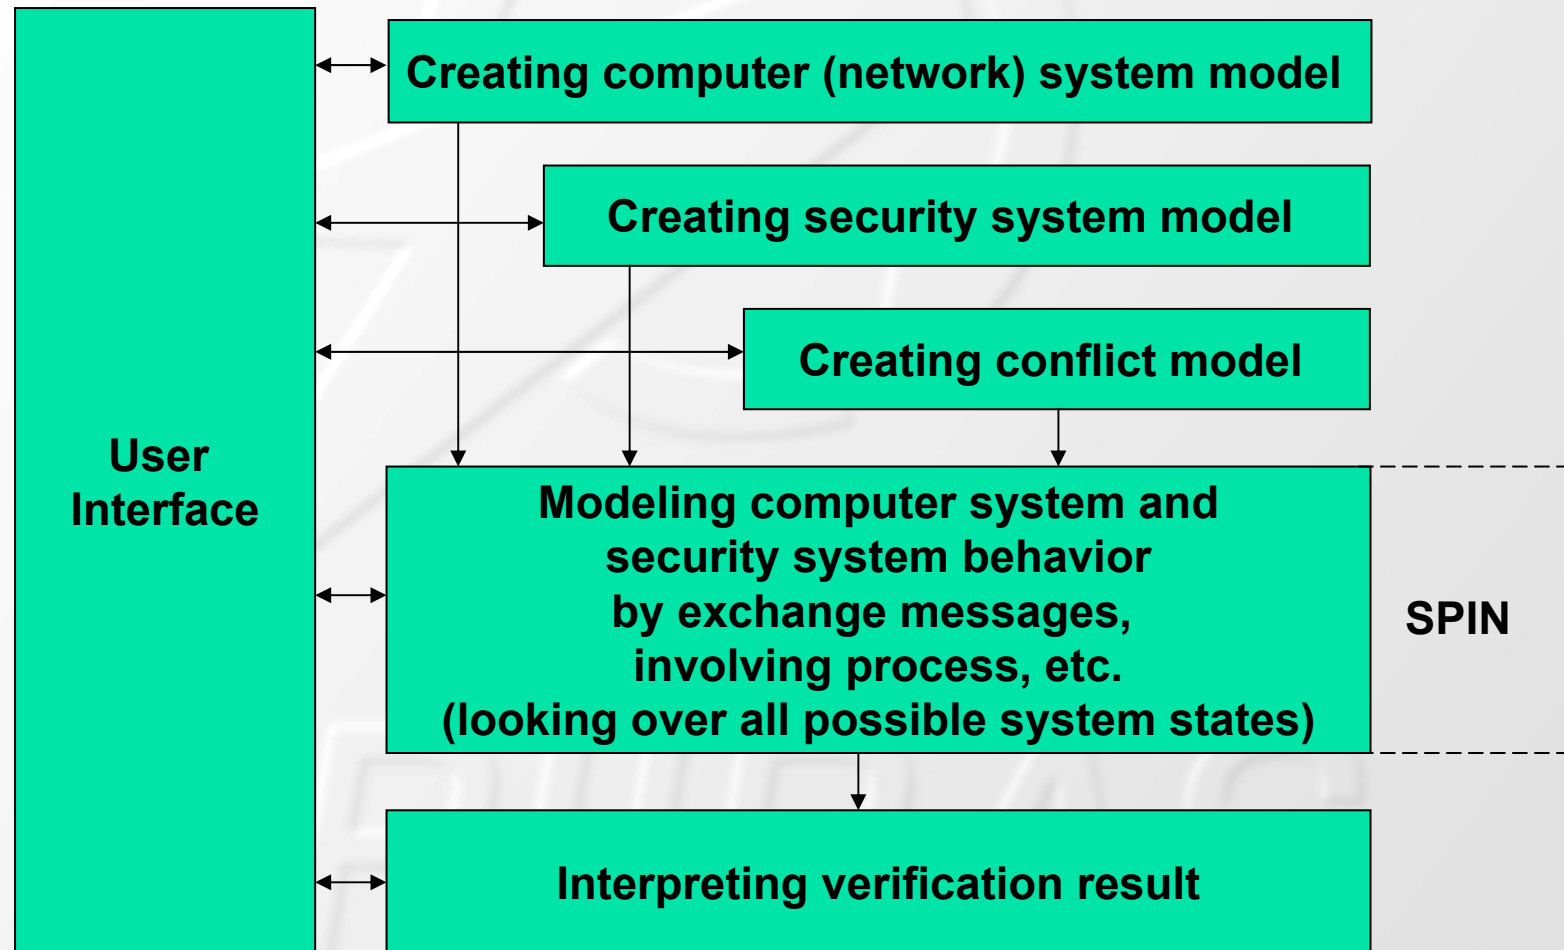

Implementation of security policy verification system

- VerificationManager
 - registers, loads and authenticates verification modules
 - invokes verify() method of verification modules for policy consistency and enforceability checks
 - debugs policy if conflicts have been found
 - open for new verification modules
 - semi-lattice-based, semantic approach
- VerificationModule
 - checks for policy consistency and predicts policy violations
 - resolves conflicts by means of a resolution strategy
- permits independent development of module
 - speed up implementation
- needs administrator to check or change results
 - choosing between proposed alternatives
